NUOVA SERIE E

Eccellenza tecnologica, **Efficienza** meccanica, **Economie** di esercizio e funzionamento, **Esperienza** industriale DANA. Questi sono i pregi della nuova **Serie E**: la soluzione ideale per l'industria del terzo millennio.

Infatti questa innovativa serie di riduttori epicicloidali, perfetta per applicazioni industriali con coppie e potenze intermedie, è la risposta DANA alle esigenze di clienti globalizzati, che richiedono più prestazioni in spazi compatti e limitati.

La nuova **Serie E** rilancia il concetto di modularità, di cui DANA è alfiere da mezzo secolo, amplificandolo con sostanziose innovazioni tecnologiche: perni a sbalzo, stadi di riduzione a quattro satelliti, ingranaggi rettificati con profilo ottimizzato.

DANA ha progettato le grandezze (e suddiviso i rapporti di riduzione) seguendo una logica matematica scalare e coerente, per fornire la soluzione più adatta alle diverse necessità applicative dei Clienti.

La nuova **Serie E** regala concreti benefici in termini di performance e di processo produttivo:

- **Incremento della vita utile e della durata** dei riduttori, grazie alla maggiore capacità di carico dei cuscinetti, dei satelliti e dei porta-satelliti.
- **Massima silenziosità di funzionamento**, grazie agli ingranaggi rettificati a perfetto ingranamento, con positivi miglioramenti della potenza termica e dell'affidabilità dei riduttori.
- **Dimensioni e ingombri ulteriormente ridotti**, che sono un vantaggio concreto per i clienti e i progettisti, sia di impianti industriali che di macchine semoventi.
- **Minore peso** dei riduttori a parità di prestazioni.
- **Compatibilità** con la precedente gamma epicicloidale DANA, che rende la nuova **Serie E** spesso intercambiabile in diverse soluzioni applicative.

NEW E-SERIES

Technological Excellence, Mechanical Efficiency, Operating Economies, DANA industrial Expertise. These are the qualities of the new E Series: the ideal solution for industry in the third millennium.

In fact this innovative series of planetary gear units, perfect for industrial applications with intermediate powers and torques, is the DANA answer to the needs of globalized customers who require more performance in compact and limited spaces.

The new E Series relaunches the concept of modularity, championed by DANA for half a century, enhancing it with substantial technological innovations: overhung pins, reduction stages with four planetary gears, ground gears with optimized profile.

DANA has designed the sizes (and subdivided reduction ratios) following a scalar and coherent mathematical logic, to provide the best solution for the various application needs of Customers.

The new E Series delivers tangible benefits in terms of performance and production process:

- *Longer duration and service life of the gear units, thanks to increased load capacity of the bearings, planetary gears and planetary carriers.*
- *Very quiet operation, due to ground gears with perfect meshing, with positive improvements in thermal rating and reliability of the reduction gear units.*
- *Sizes and overall dimensions further reduced, offering a real advantage for customers and designers of industrial systems as well as self-propelled machines.*
- *Lighter weight of the reduction gear units at equivalent performance.*
- *Compatibility with the previous DANA planetary range, which makes the new E Series often interchangeable in various application solutions.*

NEU E-SERIE

Technologische Exzellenz, mechanische Effizienz, wirtschaftlicher Betrieb, Erfahrung in der Industrie: DANA.

Das sind die Vorteile der neuen **Serie E**: Die ideale Lösung für die Industrie im dritten Jahrtausend.

Diese innovative Serie Planetengetriebe, ausgezeichnet geeignet für industrielle Anwendungen mit mittleren Drehmomenten und Leistungen ist die Antwort von DANA auf die Anforderungen der Kunden in einer globalisierten Welt, die höhere Leistung, kompaktere Ausführungen mit wenig Platzbedarf verlangen.

Die neue **Serie E** ist wieder ein Baukastensystem, dessen Verfechter DANA bereits seit einem halben Jahrhundert ist. Erweitert wird die Serie durch wesentliche technologische Innovationen: Planetenträgerbolzen, Übersetzungsstufen mit vier Planetenradrädern, Zahnräder mit optimiertem Profil.

DANA hat die Baugrößen (unterteilt in Übersetzungsstufen) in passende Gruppen ausgelegt, um den Kunden für die unterschiedlich benötigten Anwendungen besser geeignete Lösungen anbieten zu können.

Die neue **Serie E** bringt Vorteile bei der Leistung und für den Produktionsprozess:

- **Längere Betriebszeiten und Lebensdauer** der Getriebe dank erhöhter Lastkapazitäten bei Lager, Umlaufrädern und Planeteradträger.
- **Besonders ruhiger Betrieb** dank perfektem Zahneingriff, mit Verbesserung der Wärmeleistung und der Zuverlässigkeit der Getriebe.
- **Weitere Verringerung in den Abmaßen** und des Platzbedarfs sind konkrete Vorteile für die Kunden und die Planer, sowohl bei Industrieanlagen als auch bei Arbeitsmaschinen.
- **Geringeres Gewicht** bei gleichen Leistungen.
- **Kompatibilität** mit den Vorgängermodellen der Planetengetriebe von DANA ermöglicht einen Austausch gegen die neue Serie E bei den unterschiedlichen Anwendungslösungen.

- **Integrazione** con la Serie S DANA per applicazioni “heavy duty” e cicli di lavoro gravosi.
- **Tempi di consegna veloci**, grazie a razionali processi manifatturieri e di logistica industriale.

In dettaglio, la **Serie E** è articolata su 9 grandezze armonicamente scalari, con una coppia che si sviluppa da 1'200 Nm a 26'000 Nm.

Disponibile sia in esecuzione in linea che in esecuzione ortogonale, offre a catalogo fino a 4 stadi di riduzione (su richiesta del cliente può salire fino a 6 stadi). I rapporti di riduzione coprono un orizzonte molto ampio, da 1:3 fino a 1:3'000 ed oltre.

La flessibile e modulare struttura del riduttore si abbina a numerose versioni in uscita: flangiato ad albero femmina, con femmina pendolare, flangiato ad albero maschio, supporto con piedi.

La nuova **Serie E** offre le versatili configurazioni in ingresso con albero veloce ed è predisposta per motori elettrici e oleodinamici. Ci sono ampie disponibilità di freni, per le più svariate necessità applicative. Inoltre è dotata di una completa gamma di accessori, sia in ingresso che in uscita.

- *Integration with the DANA S Series for “heavy duty” applications and heavy work cycles.*
- *Prompt delivery times, thanks to rational manufacturing processes and industrial logistics.*

In detail, the E Series comprises 9 harmonically developed sizes, with torque from 1'200 Nm to 26'000 Nm.

Available in in-line and right-angle execution, and up to 4 reduction stages (up to 6 stages on customer request). The reduction ratios cover a very wide range, from 1:3 to 1:3'000 and over.

The gear unit's flexible and modular structure comes with many output versions: flanged shaft female, with hollow shaft mounting, flanged male shaft, support with feet.

The new E Series offers versatile input configurations with input shaft and is arranged for electric and hydraulic motors. Wide availability of brakes, for the most varied application needs. There is also a complete range of input and output accessories.

- **Integrierung** in die Serie S von DANA für „Heavy-Duty-Anwendungen“ und bei erschweren Arbeitszyklen.
- **Kurze Lieferzeiten**, dank rationaler Fertigungsprozesse und industrieller Logistik.

Im Detail, die **Serie E** besteht aus 9 aufeinander stufenweise abgestimmten Größen, mit einem Drehmoment zwischen 1'200 Nm und 26'000 Nm.

Erhältlich sowohl als In-Line-Ausführung als auch als Winkelgetriebe mit dem Katalog bis zu 4 angebotenen Übersetzungsstufen (auf Kundenwunsch bis zu 6 Stufen möglich). Die Übersetzungsverhältnisse decken einen großen Bereich ab, von 1:3 fino bis 1:3'000 und mehr.

Zum flexiblen und modularen Aufbau des Getriebes kommen noch zahlreiche Abtriebsausführungen hinzu: Flanschgetriebe mit Hohlwelle, Aufsteckhohlwelle, Flanschgetriebe mit Vollwelle, Fußleisten montierte Getriebe.

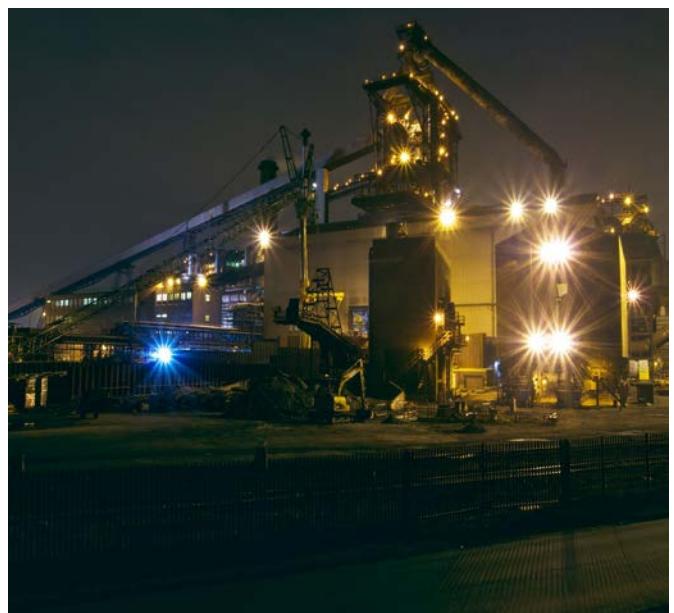

Die neue **Serie E** bietet zahlreiche Konfigurationen für Ausführungen mit antriebseitiger schnell laufender Welle und Vorrüstung für Elektro- und Hydraulikmotoren. Angeboten wird ein breites Angebot an Bremsen, für die unterschiedlichsten Anwendungsforderungen. Darüber hinaus bieten wir sowohl antriebs- als auch abtriebsseitig ein weit gefächertes Angebot an Zubehör.

4. DESCRIZIONI TECNICHE

4. TECHNICAL DESCRIPTION

4. TECHNISCHE BESCHREIBUNGEN

Coppia nominale in uscita

T_{2N} [Nm]

Rappresenta la coppia in uscita convenzionale che identifica la grandezza del riduttore.

Coppia trasmissibile in uscita

T_2 [Nm]

Rappresenta la coppia trasmissibile in uscita dal riduttore con carico continuo e uniforme (fattore di servizio $f_s=1$), per diversi valori del fattore di durata n_{2xh} .

I valori di T_2 sono calcolati secondo gli standard ISO 6336 per gli ingranaggi e ISO 281 per i cuscinetti e sono riportati nelle tabelle di selezione delle grandezze.

Coppia massima in uscita

T_{2MAX} [Nm]

Rappresenta la coppia massima trasmissibile in uscita dal riduttore come valore di punta o per brevi durate. Per azionamenti che comportano un elevato numero di avviamenti o inversioni, anche la coppia massima di impiego deve essere opportunamente limitata in relazione alla resistenza degli ingranaggi o degli alberi. I valori di T_{2MAX} sono riportati nelle tabelle di selezione delle grandezze.

Coppia richiesta in uscita

T_{2R} [Nm]

Rappresenta la coppia richiesta in uscita dall'applicazione e dovrà essere sempre inferiore alla coppia trasmissibile T_2 in uscita del riduttore selezionato.

Coppia massima richiesta in uscita

T_{2RMAX} [Nm]

Rappresenta la coppia in uscita massima richiesta dall'applicazione e dovrà essere sempre inferiore alla coppia massima in uscita trasmissibile T_{2MAX} del riduttore selezionato.

Coppia frenante in ingresso

T_B [Nm]

Rappresenta la coppia frenante statica erogata dal freno lamellare che può essere installato in ingresso al riduttore.

I valori di T_B sono riportati, per le varie configurazioni di freno, al capitolo "Freni lamellari a bagno d'olio".

Nominale output torque

T_{2N} [Nm]

The conventional output torque that identifies the size of the gear unit.

Transmissible output torque

T_2 [Nm]

The transmissible gear unit output torque with uniform and continuous load (duty factor $f_s=1$), for different values of the duration factor n_{2xh} .

The T_2 values are calculated according to ISO 6336 standards for the gears and ISO 281 for the bearings, and are given in the size selection tables.

Max output torque

T_{2MAX} [Nm]

The transmissible gear unit output torque as the peak value or for short periods. For drives involving a high number of starts or reversals, also the max. operational torque must be opportunely limited according to the fatigue resistance of the gears or shafts.

The T_{2MAX} values are given in the size selection tables.

Required output torque

T_{2R} [Nm]

The output torque required by the application; it must always be less than the transmissible output torque T_2 of the selected gear unit.

Required max. output torque

T_{2RMAX} [Nm]

The maximum output torque required by the application; it must always be less than the maximum transmissible output torque T_{2MAX} of the selected gear unit.

Input braking torque

T_B [Nm]

The static braking torque delivered by the multi-disc brake that can be installed on the gear unit input.

The T_B values, for the various brake configurations, are given in the section "Oil bath multi-disc brakes".

Abtriebsnennmoment

T_{2N} [Nm]

Ist das konventionelle Abtriebsmomentals Kennzeichnung der Größe.

Übertragbares Abtriebsdrehmoment

T_2 [Nm]

Ist das übertragbare Abtriebsdrehmoment bei kontinuierlicher und uniformer Last (Betriebsfaktor $f_s=1$), bei verschiedenen Werten des Lebensdauerfaktors n_{2xh} .

Die Werte T_2 werden nach dem Standards ISO 6336 für Getriebe und ISO 281 für Lager berechnet. Sie sind in der Tabelle für die Größenauswahl angegeben.

Max. Abtriebsmoment

T_{2MAX} [Nm]

Ist das maximal übertragbare Abtriebsmoment des Getriebes als Spitze und kurzzeitig. Bei Antrieben mit einer hohen Anzahl von Starts oder Umsteuerungen muss auch das maximale Betriebsdrehmoment entsprechend der Ermüdbeständigkeit der Zahnräder oder Wellen begrenzt werden.

Die Werte für T_{2MAX} sind in der Tabelle für die Auswahl der Größe aufgeführt.

Gefordertes Abtriebsmoment

T_{2R} [Nm]

Ist das erforderliche Abtriebsmoment für die Anwendung. Muss immer unter dem übertragbaren Abtriebsmoment T_2 des ausgewählten Getriebes liegen.

Gefordertes max. Abtriebsmoment

T_{2RMAX} [Nm]

Ist das erforderliche maximale Abtriebsmoment für die Anwendung. Muss immer unter dem übertragbaren max. Abtriebsmoment T_{2MAX} des ausgewählten Getriebes liegen.

Antriebsbremsmoment

T_B [Nm]

Ist das statische Bremsmoment der Lamellenbremse, die antriebsseitig am Getriebe eingebaut werden kann.

Die Werte für T_B sind für die unterschiedlichen Bremskonfigurationen unter dem Abschnitt „Ölbad-Lamellenbremsen“ angegeben.

Coppia frenante richiesta in ingresso

T_{BR} [Nm]

Rappresenta la coppia frenante richiesta in ingresso al riduttore qualora l'applicazione preveda l'utilizzo di un freno in ingresso.

E' calcolabile con la seguente relazione:

in cui

- S_f rappresenta un fattore di sicurezza sul freno
- T_{2R} la coppia richiesta in uscita
- i il rapporto di riduzione

Il fattore di sicurezza sul freno S_f dipende dal tipo di applicazione e deve essere indicato dal Cliente: talvolta il suo valore minimo è indicato da regolamenti specifici rilevanti per l'applicazione.

Velocità in ingresso

n_1 [rpm]

Rappresenta la velocità del motore collegato al riduttore o, in generale, la velocità dell'organo in ingresso al riduttore: nel caso di azionamenti con pulegge e cinghie, ad esempio, il valore deve tener conto del relativo rapporto di riduzione.

Velocità massima in ingresso

n_{1MAX} [rpm]

Rappresenta la velocità massima in ingresso al riduttore per brevi periodi oppure in condizioni di servizio intermittente. E' consentita la permanenza alla velocità n_{1MAX} per un tempo massimo di 1 minuto seguito da un periodo di raffreddamento del riduttore. Nel caso in cui siano previsti periodi di permanenza più lunghi a tale velocità, si consiglia di contattare il referente DANA di zona.

I valori di n_{1MAX} sono riportati nelle tabelle di selezione.

Velocità in uscita

n_2 [rpm]

Rappresenta la velocità in uscita al riduttore. E' calcolabile con la seguente formula:

in cui n_1 rappresenta la velocità in ingresso e i il rapporto di riduzione del riduttore.

Required input braking torque

T_{BR} [Nm]

The required gear unit input braking torque if the application involves the use of an input brake.

It can be calculated with the following equation:

$$T_{BR} = \frac{S_f \times T_{2R}}{i} \quad [\text{Nm}]$$

(1)

where

- S_f a brake safety factor
- T_{2R} the required output torque
- i the reduction ratio

The brake safety factor S_f depends on the type of application and must be specified by the Customer: sometimes its minimum value is indicated by the specific regulations relevant to the application.

Gefordertes Antriebsbremsmoment

T_{BR} [Nm]

Ist das geforderte Antriebsbremsmoment für das Getriebe, wenn die Anwendung den Einsatz einer Antriebsbremse fordert.

Kann mit folgender Formel berechnet werden:

Dabei ist

- S_f Sicherheitsfaktor der Bremse
- T_{2R} Gefordertes Abtriebsmoment
- i Übersetzungsverhältnis

Der Sicherheitsfaktor der Bremse S_f ist abhängig von der Anwendung und ist vom Kunden anzugeben: Manchmal wird der Mindestwert in spezifischen Vorschriften der Anwendung angegeben.

Input speed

n_1 [rpm]

The speed of the motor connected to the gear unit or, in general, the speed of the gear unit input part: in case of drives with pulleys and belts, for example, the value must take into account the relevant reduction ratio.

Max input speed

n_{1MAX} [rpm]

The maximum gear unit input speed for short periods or in conditions of intermittent duty. Staying at the speed n_{1MAX} for a maximum time of 1 minute followed by a gear unit cooling period is allowed. If longer periods at that speed are foreseen, it is advisable to consult the DANA area contact person.

The n_{1MAX} values are given in the selection tables.

Antriebsdrehzahl

n_1 [rpm]

Ist die Drehzahl des an das Getriebe angeschlossenen Motors oder allgemein, Drehzahl des antriebsseitigen Organs: Bei Antrieben mit Scheiben oder Riemen zum Beispiel muss der Wert die entsprechende Übersetzung berücksichtigen.

Max. Antriebsdrehzahl

n_{1MAX} [rpm]

Ist die maximale Antriebsdrehzahl des Getriebes für kurze Zeiträume oder bei Aussetzbetrieb. Erlaubt ist die Laufzeit mit der Drehzahl n_{1MAX} für maximal 1 Minute mit nachfolgender Abkühlzeit des Getriebes. Sollten längere Laufzeiten mit dieser Drehzahl vorgesehen sein, raten wir, sich an die DANA Kontaktperson der zone zu wenden.

Die Werte für n_{1MAX} sind in der Auswahl-tabelle aufgeführt.

Output speed

n_2 [rpm]

The gear unit output speed. It can be calculated with the following formula:

$$n_2 = \frac{n_1}{i} \quad [\text{rpm}]$$

(2)

where n_1 is the input speed and i the gear unit reduction ratio.

Abtriebsdrehzahl

n_2 [rpm]

Ist die Abtriebsdrehzahl am Getriebe. Kann mit folgender Formel berechnet werden:

Rapporto di riduzione

i

Rappresenta la relazione fra la velocità in ingresso n_1 ed uscita n_2 .

Reduction ratio

i

The ratio between the input speed n_1 and output speed n_2 .

$$i = \frac{n_1}{n_2}$$

(3)

Potenza in ingresso

P_1 [kW]

Rappresenta la potenza applicata all'ingresso del riduttore. E' calcolabile con la seguente formula:

Input power

P_1 [kW]

The power applied at the input of the gear unit. It can be calculated with the following formula:

$$P_1 = \frac{P_2}{\eta_d} \quad [\text{kW}]$$

(4)

in cui

- P_2 rappresenta la potenza in uscita
- η_d rappresenta il rendimento dinamico del riduttore, il cui valore è riportato nella tabella (4)

where

- P_2 is the output power
- η_d is the dynamic efficiency of the gear unit, whose value is given in the table (4)

Antriebsleistung

P_1 [kW]

Ist die angelegte Leistung antriebsseitig vom Getriebe. Kann mit folgender Formel berechnet werden:

Potenza in uscita

P_2 [kW]

Rappresenta la potenza trasmessa all'uscita del riduttore. E' calcolabile con la seguente formula:

Output power

P_2 [kW]

The power transmitted at the output of the gear unit. It can be calculated with the following formula:

$$P_2 = \frac{T_{2R} \times n_2}{9.550} \quad [\text{kW}]$$

(5)

in cui T_{2R} rappresenta la coppia richiesta in uscita e n_2 la velocità in uscita.

where T_{2R} is the required output torque and n_2 the output speed.

dabei ist T_{2R} das geforderter Abtriebsmoment und n_2 die Abtriebsdrehzahl.

Potenza termica

P_T [kW]

Rappresenta la potenza che il riduttore può trasmettere in modo continuativo nelle seguenti condizioni:

- con lubrificazione a sbattimento e in assenza di un circuito ausiliario di raffreddamento
- con montaggio in posizione orizzontale
- ad una velocità di ingresso di 1'500 rpm
- per una temperatura massima dell'olio di 80 °C (olio con viscosità ISO VG150)
- ad una temperatura ambiente di 20 °C
- nella condizione di impiego "ambiente grande"

I valori di P_T sono riportati nelle tabelle di selezione delle varie grandezze.

Qualora il tipo di funzionamento, la posizione di montaggio, la velocità in ingresso, la temperatura ambiente oppure l'ambiente di impiego siano diversi da quelli sopra indicati, è opportuno correggere il valore della potenza termica attraverso i fattori f_K , f_V e f_R di seguito indicati.

Thermal power

P_T [kW]

The power that the gear unit can transmit continuously in the following conditions:

- with splash lubrication and in the absence of an auxiliary cooling circuit
- with mounting in a horizontal position
- at an input speed of 1'500 rpm
- for a max. oil temperature of 80 °C (oil with viscosity ISO VG150)
- at an ambient temperature of 20 °C
- in the "large environment" condition of use

The P_T values are given in the tables for selection of the various sizes.

If the type of operation, the mounting position, the input speed, the ambient temperature or the operating environment are different from those indicated above, it is advisable to correct the thermal power value through the factors f_K , f_V and f_R indicated below.

Wärmeleistung

P_T [kW]

Ist die Leistung, die vom Getriebe kontinuierlich unter folgenden Bedingungen übertragen werden kann:

- mit Tauchschmierung und ohne zusätzliche Kühlkreis
- waagerecht montiert
- Antriebsdrehzahl 1'500 rpm
- Höchsttemperatur des Öls 80 °C (Viskosität des Öls ISO VG150)
- Umgebungstemperatur von 20 °C
- Einsatzbedingung „große Halle“

Die Werte für P_T sind in der Tabelle für die Auswahl bei den verschiedenen Größen aufgeführt.

Sind der Betriebstyp, die Einbauposition, die Antriebsdrehzahl, die Umgebungstemperatur oder die Einsatz Umgebung anders als oben angegeben, sollten die Werte für die Wärmeleistung mittels der Faktoren f_K , f_V und f_R , die nachstehend angegeben sind, korrigiert werden.

Fattore termico

f_K

Nel caso di cicli di lavoro che prevedono un impiego intermittente del riduttore e/o una temperatura ambiente diversa da 20 °C, la potenza termica del riduttore può essere adeguata all'applicazione specifica tramite il fattore f_K riportato nella tabella seguente.

Thermal factor

f_K

With work cycles requiring an intermittent use of the gear unit and/or the presence of an ambient temperature different from 20 °C, the gear unit thermal rating can be adjusted to the specific application by means of the factor f_K given in the following table.

Wärmefaktor

f_K

Bei Arbeitszyklen des Getriebes mit Aussetzbetrieb und/oder bei Umgebungstemperaturen, die von 20 °C abweichen, kann die Wärmeleistung des Getriebes mithilfe des in der nachstehenden Tabelle aufgeführten Faktors f_K an die spezifische Anwendung angepasst werden.

f_K	Fattore d'intermittenza I <i>Duty cycle I</i> Anwendungsfaktor I [%]	Temperatura ambiente / <i>Ambient temperature</i> / Umgebungstemperatur [°C]				
		10°	20°	30°	40°	50°
	100	1.15	1	0.85	0.7	0.6
	80	1.25	1.1	1	0.85	0.7
	60	1.4	1.25	1.1	1	0.85
	40	1.6	1.4	1.25	1.1	1
	20	1.8	1.6	1.4	1.25	1.1

Tab. (1)

Il fattore d'intermittenza I può essere calcolato come segue:

The duty cycle I can be calculated as follows:

Der Awendunsfaktor I kann wie folgt berechnet werden:

$$I = \frac{t_f}{t_f + t_r} \times 100 \quad (6)$$

dove t_f rappresenta il tempo di funzionamento a potenza costante e t_r il tempo a riposo.

where t_f is the time of operation at constant power and t_r the rest time.

dabei ist t_f die Betriebszeit mit konstanter Leistung und t_r die Ruhezeit.

Fattore di velocità

f_V

Nel caso in cui la velocità in ingresso sia diversa da 1'500 rpm, l'adeguamento della potenza termica alla situazione specifica può avvenire tramite l'impiego del fattore f_V riportato nella tabella seguente. La tabella fa riferimento alle diverse posizioni di montaggio del riduttore.

Speed factor

f_V

If the input speed is different from 1'500 rpm, the adjustment of thermal power to the specific situation can occur through the use of the factor f_V given in the following table. The table refers to the different gear unit mounting positions.

Drehzahlfaktor

f_V

Bei einer anderen Antriebsdrehzahl als 1'500 rpm kann die Anpassung der Wärmeleistung an die spezifische Situation mit dem Faktor f_V , der in der folgenden Tabelle angegeben ist, erfolgen. Die Tabelle bezieht sich auf die unterschiedlichen Einbaupositionen des Getriebes.

f_V	Posizioni di montaggio <i>Mounting positions</i> Montagepositionen	n_1 [rpm]					
		3'000	2'500	2'000	1'500	1'000	700
	Montaggio orizzontale <i>Horizontal mounting</i> Horizontale Montage	0.50	0.65	0.80	1.00	1.15	1.30
	Montaggio verticale <i>Vertical mounting</i> Vertikale Montage	0.40	0.48	0.58	0.71	0.88	1.00

Tab. (2)

Fattore ambiente

f_R

Nel caso in cui il riduttore sia collocato in un ambiente ristretto oppure all'aperto, la potenza termica può essere adeguata con l'ausilio del fattore f_R riportato nella tabella a pagina seguente.

Environmental factor

f_R

If the gear unit is located in a limited space or outdoors, the thermal power can be modified with the aid of the factor f_R given in the table on the next page.

Umweltfaktor

f_R

Falls das Getriebe in einer engen Umgebung oder im Freien aufgestellt ist, kann die Wärmeleistung mithilfe des Faktors f_R , der in der Tabelle auf der folgenden Seite, aufgeführt ist, angepasst werden.

	Ambiente ristretto <i>Small space</i> Kleiner Raum	Ambiente grande <i>Large space</i> Großer Raum	All'aperto <i>Outdoors</i> Im Freien
f_R	0.70	1.00	1.35

Tab. (3)

Nel caso più generale, la potenza termica corretta del riduttore risulterà

In general, the corrected thermal power of the gear unit will be

Ganz allgemein kann die richtige Wärmeleistung mit folgender Formel berechnet werden

$$P_{T1} = P_T \times f_K \times f_V \times f_R \quad [\text{kW}] \quad (7)$$

La potenza P_1 applicata al riduttore deve risultare sempre inferiore alla potenza termica corretta P_{T1} .

The power P_1 applied to the gear unit must always be less than the corrected thermal power P_{T1} .

Die am Getriebe angelegte Leistung P_1 muss immer unter der korrigierten Wärmeleistung P_{T1} liegen.

$$P_1 \leq P_{T1} \quad (8)$$

Nel caso in cui la potenza termica corretta risulti inferiore alla potenza applicata, anche solo in una condizione dell'eventuale ciclo di impiego, occorre prevedere la presenza di un circuito ausiliario di raffreddamento.

In tali condizioni la potenza termica da dissipare P_C è calcolabile con la seguente relazione:

If the thermal power of the gear unit is less than the power applied, even in just one condition of the possible operating cycle, an auxiliary cooling circuit must be provided.

In such conditions, the thermal power to be dissipated P_C can be calculated with the following equation:

$$P_C = (P_1 - P_{T1}) \times (1 - \eta_d) \quad [\text{kW}] \quad (9)$$

essendo η_d il rendimento dinamico del riduttore ricavabile dalla tabella (4).

η_d being the dynamic efficiency of the gear unit obtainable from the table (4).

Falls die korrigierte Wärmeleistung unter der zu übertragende Leistung liegt, selbst für eine einzige Bedingung des möglichen Einsatzzyklus, muss ein zusätzliches Kühlssystem installiert werden. In solchen Fällen kann die abzuleitende Wärmeleistung P_C nach folgender Formel berechnet werden:

dabei ist η_d der dynamische Wirkungsgrad des Getriebes, entnehmbar aus der Tabelle (4).

Temperatura

[°C]

La temperatura ambiente raccomandata è compresa nell'intervallo -20°C / +40°C. La temperatura di funzionamento ideale del riduttore è compresa tra 50°C e 70°C, cui corrispondono una temperatura dell'olio fra 60°C e 80°C all'incirca. Per brevi periodi, la temperatura dell'olio può raggiungere 90°C.

Il sistema migliore per tenere sotto controllo la temperatura è quello di ricorrere ad un sistema ausiliario di scambio termico.

Per basse temperature ambiente, oppure per applicazioni caratterizzate da elevate temperature di funzionamento, è necessario selezionare lubrificanti adeguati e guarnizioni realizzate in materiali opportuni.

A questo scopo sono disponibili guarnizioni in diversi tipi di elastomero, come nitrilbutadiene (NB), fluorato (FP) e siliconico (SI).

Contattare il referente DANA di zona per le indicazioni del caso. Al capitolo "Lubrificazione" sono riportati consigli sulla scelta del lubrificante più adeguato per le diverse condizioni.

Temperature

[°C]

The recommended ambient temperature is in the range -20°C / +40°C. The ideal gear unit operating temperature is between 50°C and 70°C, which corresponds to an oil temperature of approx. between 60°C and 80°C. For short periods, the oil temperature can reach 90°C.

The best system to keep the temperature under control is to use an auxiliary heat exchange system.

For low ambient temperatures, or for applications characterized by high operating temperatures, it is necessary to select appropriate lubricants and seals made of suitable materials.

Seals in different types of elastomer, such as nitrile butadiene (NB), fluoride (PF) and silicone(SI) are available for this purpose.

Consult the DANA area contact person, for the relevant indications. The section "Lubrication" gives advice on choosing the most appropriate lubricant for the different conditions.

Temperatur

[°C]

Die empfohlene Umgebungstemperatur liegt zwischen -20 °C / +40 °C. Die ideale Betriebstemperatur des Getriebes liegt zwischen 50 °C und 70 °C, entsprechend einer Öltemperatur zwischen etwa 60 °C und 80 °C. Kurzzeitig kann die Öltemperatur 90 °C erreichen.

Die beste Methode, die Temperatur unter Kontrolle zu halten, besteht in einem zusätzlichen Wärmetauschersystem.

Bei niedrigen Umgebungstemperaturen oder bei Anwendungen mit erhöhten Betriebstemperaturen müssen entsprechende Schmiermittel und Dichtungen aus geeignetem Material gewählt werden.

Zu diesem Zweck bieten wir Dichtungen aus unterschiedlichen Elastomeren, wie Nitril-Butadien-Kautschuk (NB), Fluorat (FP) und Silikon (SI) an.

Nehmen Sie dazu Kontakt sich an die DANA Kontaktperson der zone zu wenden. Unter dem Abschnitt „Schmierung“ finden Sie Ratschläge über die geeigneten Schmiermittel für unterschiedliche Bedingungen.

Rendimento dinamico

η_d

E' dato dal rapporto fra la potenza P_2 trasmessa in uscita dal riduttore e quella P_1 applicata in ingresso ed è calcolabile con la seguente formula:

$$\eta_d = \frac{P_2}{P_1}$$

Il suo valore dipende da numerosi fattori, fra i quali: la potenza trasmessa, la velocità in ingresso, la viscosità del lubrificante, la temperatura di funzionamento e il rapporto di riduzione. I valori indicativi del rendimento dinamico sono riportati nella tabella seguente.

Stadi di riduzione / Reduction stages / Reduktionsstufen				
	1	2	3	4
	EL	EL - EC	EL - EC	EL - EC
η_d	0.98	0.96	0.94	0.92

Tab. (4)

Fattore di servizio

f_s

Il fattore di servizio dipende dal tipo di motore primo e dal tipo di macchina azionata dal riduttore. Si tratta di un valore empirico, stabilito attraverso l'esperienza storica delle diverse applicazioni e tiene conto delle variazioni di carico, degli urti della trasmissione e dell'incertezza relativa alla variazione dei parametri che concorrono alla trasmissione della potenza.

La tabella sotto riportata indica i valori del fattore di servizio in funzione della natura del carico, del tipo di azionamento (motore elettrico, idraulico ed endotermico) e del numero di avviamenti orari della macchina azionata.

Duty factor

f_s

The duty factor depends on the type of prime mover and the type of machine driven by the gear unit. This is an empirical value drawn from experience with the various applications and takes into account the variations of load, transmission impacts and uncertainty relevant to the variation of parameters involved in the transmission of power.

The table below gives the duty factor values according to the nature of the load, the type of drive (electric, hydraulic and endothermic motor) and the number of starts per hour of the driven machine.

Betriebsfaktor

f_s

Der Betriebsfaktor hängt vom Typ des Primärmotors und der Art der vom Getriebe angetriebenen Maschine ab. Es handelt sich um einen empirischen Wert, der auf der Erfahrung mit verschiedenen Anwendungen beruht und der die Laständerungen, die Übertragungswucht und die Ungewissheit der Parameteränderung bei der Leistungsübertragung einbezieht.

In der nachstehenden Tabelle sind die Werte für den Betriebsfaktor entsprechend der Lastart, der Antriebsart (Elektro-, Hydraulik- und endothermischer Motor) und der Anzahl der Starts pro Stunde der angetriebenen Maschine, angegeben.

f_s		Natura del carico Type of load Belastungsart	Tipologia di azionamento Type of drive Antriebsart	N° avviameni /h N° of starts /hour Schaltungen /Std				
				16	32	63	125	250
f_s	a	Uniforme Uniform load Gleichmäßig	Mot. elettrico / Electric motor / Elektromotor	1.05	1.10	1.15	1.25	1.40
			Mot. idraulico / Hydraulic motor /Hydraulikmotor	1.05	1.05	1.10	1.15	1.20
			Mot. endotermico / Endothermic engine / Endotermischer Motor	1.25	--	--	--	--
	b	Variabile con urti moderati Moderate shock load Variable mit mäßigen Stößen	Mot. elettrico / Electric motor / Elektromotor	1.10	1.15	1.20	1.40	1.60
			Mot. idraulico / Hydraulic motor /Hydraulikmotor	1.05	1.00	1.10	1.20	1.30
			Mot. endotermico / Endothermic engine / Endotermischer Motor	1.50	--	--	--	--
	c	Variabile con urti forti Heavy shock load Variable mit starken Stößen	Mot. elettrico / Electric motor / Elektromotor	1.20	1.30	1.40	1.60	1.80
			Mot. idraulico / Hydraulic motor /Hydraulikmotor	1.10	1.20	1.25	1.35	1.50
			Mot. endotermico / Endothermic engine / Endotermischer Motor	2.00	--	--	--	--

Tab. (5)

Per quanto riguarda la natura del carico, la seguente tabella (6) fornisce una classificazione delle macchine più diffuse secondo i tre livelli **a**, **b** e **c** indicati nella precedente tabella (5).

Regarding the nature of the load, the following table (6) provides a classification of the most common machines according to the three levels **a**, **b** and **c** given in the previous table (5).

Mit Bezug auf die Lastart werden in folgender Tabelle (6) die Maschinen, die am weitesten verbreitet sind, in drei Gruppen eingeteilt **a**, **b** e **c**, wie in der vorausgehenden Tabelle (5) angegeben.

	SETTORE DI APPLICAZIONE <i>FIELD OF APPLICATION</i> <i>ANWENDUNGSGEBIET</i>	MACCHINA COMANDATA <i>DRIVEN MACHINE</i> <i>ANGETRIEBENE MASCHINE</i>

Tab. (6)

Fattore di durata L_{h1}, L_{h2}

Rappresenta il prodotto fra la velocità in ingresso n_1 oppure in uscita n_2 al riduttore e le ore di funzionamento richieste dall'applicazione h_R :

Lifetime factor L_{h1}, L_{h2}

The product of input speed n_1 or output speed n_2 at the gear unit and the hours of operation required by the application h_R :

Lebensdauerfaktor L_{h1}, L_{h2}

Ergibt sich aus dem Produkt aus Antriebsdrehzahl n_1 bzw. Der Abtriebsdrehzahl n_2 des Getriebes und den von der Anwendung geforderten Betriebsstunden h_R :

$$L_{h1} = n_1 \times h_R$$

(11)

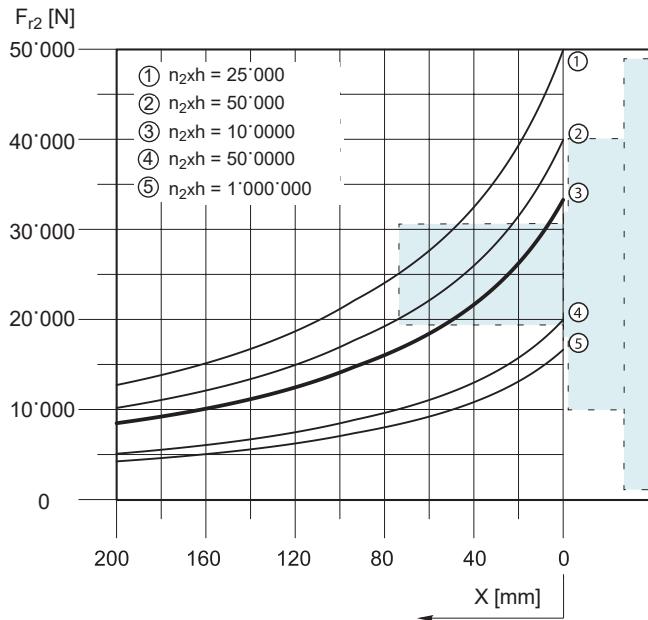

$$L_{h2} = n_2 \times h_R$$

(12)

Carichi radiali ammissibili sugli alberi in uscita / ingresso

F_{r2}, F_{r1} [N]

Per ogni grandezza di riduttore vengono riportati, nelle tabelle di selezione, i diagrammi dei carichi radiali F_{r2} e F_{r1} ammessi rispettivamente sugli alberi in uscita e in ingresso in funzione della distanza X tra il punto di applicazione del carico e la battuta dell'albero: i valori sono indicati per diversi valori del fattore di durata n_{xh} dei cuscinetti.

Per fattori di durata $n_{2xh} < 25\,000$ cicli, contattare il referente DANA di zona.

Per le grandezze E160 e E260 i valori dei carichi radiali dei supporti uscita MP-MP1 e ML-ML1 sono validi soltanto se sono utilizzati entrambi i centraggi supporto sulla struttura del cliente. In caso di non utilizzo del secondo centraggio contattare il referente DANA di zona.

Carichi assiali ammissibili sugli alberi in uscita

F_{a2} [N]

Per ogni grandezza di riduttore vengono riportati, nelle tabelle di selezione, i valori dei carichi assiali F_{a2} ammessi sugli alberi in uscita: i valori sono indicati per diversi valori del fattore di durata n_{2xh} dei cuscinetti.

Nel caso in cui si abbiano contemporaneamente sull'albero in uscita sia carichi radiali che assiali, si consiglia di contattare il referente DANA di zona.

I riduttori con albero femmina in uscita, versione FE, sono impiegati normalmente per la trasmissione di sola coppia e non sono adatti a sopportare carichi radiali e/o carichi assiali.

Nel caso di riduttori con albero femmina cavo, versioni FS e FCP, in cui siano presenti carichi assiali, si prega di contattare il referente DANA di zona.

Permissible radial loads on output / input shafts

F_{r2}, F_{r1} [N]

For each gear unit size, the selection tables give the diagrams of permissible radial loads F_{r2} and F_{r1} on the output and input shafts respectively as a function of the distance X between the point of load application and the shaft shoulder: the values are given for various bearing duration factor n_{xh} values.

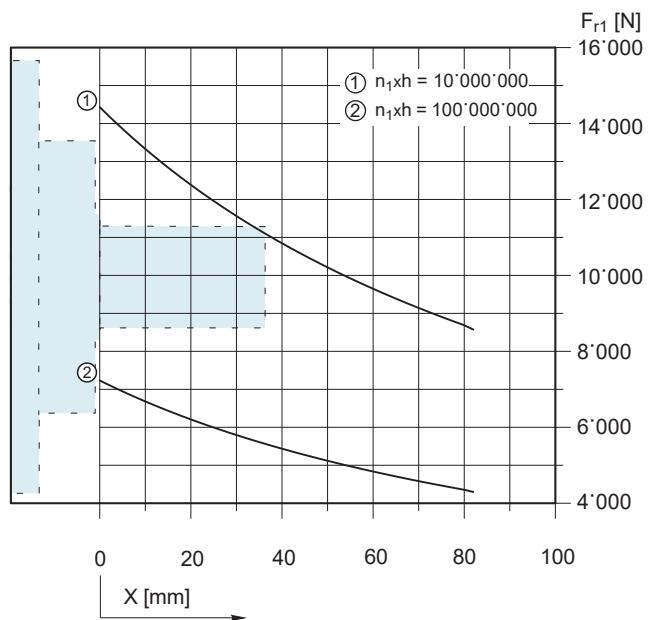

Fig. (1)

For duration factor $n_{2xh} < 25\,000$ cycles, please consult the DANA area contact person.

For sizes E160 and E260 the values of radial loads of output supports MP-MP1 and ML-ML1 are valid only if they are used both spigots on the support structure of the customer; in case of non-use of the second spigot consult the DANA area contact person.

Permissible output shaft axial loads

F_{a2} [N]

The selection tables give the permissible axial loads F_{a2} on the output shafts for each gear unit size: the values are given for various bearing duration factor n_{2xh} values.

If there are radial and axial loads on the output shaft at the same time, it is advisable to consult the DANA area contact person.

FE version gear units with female output shaft gear units are normally used for the transmission of torque only and are not designed to withstand radial and/or axial loads.

In case of FS and FCP versions gear units with hollow shaft, where there are axial loads, please consult the DANA area contact person.

Zulässige Radiallasten abtriebsseitig/antriebsseitig

F_{r2}, F_{r1} [N]

Für jede Größe werden in der Auswahltafel die Diagramme der zulässigen Radiallasten F_{r2} und F_{r1} bzw. jeweils an den Abtriebs- und Antriebswellen entsprechend dem Abstand X zwischen Lastangriffspunkt und Wellenanschlag, angegeben: Die angegebenen Werte gelten für die unterschiedlichen Lebensdauerfaktoren n_{xh} der Lager.

Für Lebensdauerfaktoren $n_{2xh} < 25\,000$ arbeitszyklen, bitte sich an die DANA Kontaktperson der zone zu wenden.

Für Größen E160 und E260 die Werte der Radiallasten der Ausgangslagerung MP-MP1 und ML-ML1 sind nur gültig, wenn beide Zentrierungen an der Tragstruktur des Kunden verwendet werden; falls die zweite Zentrierung nicht verwendet wird, wenden sie sich an die DANA Kontaktperson der zone zu wenden.

Zulässige Radiallasten abtriebsseitig

F_{a2} [N]

Für jede Größe sind in der Auswahltafel die Werte für die zulässigen Axiallasten F_{a2} an den Abtriebswellen angegeben: die angegebenen Werte gelten für unterschiedliche Lebensdauerfaktoren n_{2xh} der Lager.

Liegen an der Abtriebswellen sowohl Radial- als auch Axiallasten an raten wir Ihnen, sich an die DANA Kontaktperson der zone zu wenden.

Die Getriebe mit Hohlwellenabtrieb, Ausführung FE, werden normalerweise nur für die Übertragung von Drehmomenten eingesetzt und sind nicht für die Aufnahme von Radial- und/oder Axiallasten geeignet.

Bei Getrieben mit Hohlwelle, Ausführungen FS und FCP, bei denen Axiallasten Anliegen, sich an die DANA Kontaktperson der zone zu wenden.

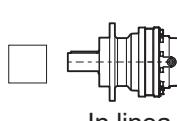

5. SELEZIONE DEL RIDUTTORE

Per la selezione del riduttore è necessaria la raccolta dei dati caratteristici dell'applicazione: a tal fine si può utilizzare la scheda di seguito riportata.

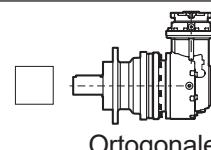

Tipologia di applicazione:

	Descrizione	Valore
T _{2R}	Coppia richiesta in uscita	[Nm]
T _{2RMAX}	Coppia massima richiesta in uscita	[Nm]
n ₂	Velocità in uscita	[rpm]
n ₁	Velocità in ingresso	[rpm]
P ₂	Potenza in uscita	[kW]
F _{rR2}	Carico radiale richiesto sull'albero in uscita	[N]
X ₂ *	Distanza applicazione carico radiale F _{rR2}	[mm]
F _{aR2} **	Carico assiale richiesto sull'albero in uscita	[N]
F _{rR1}	Carico radiale richiesto sull'albero in ingresso	[N]
X ₁ *	Distanza applicazione carico radiale F _{rR1}	[mm]
h _R	Durata richiesta	[h]
I	Fattore d'intermittenza	[%]
N	Numero di avviamenti orari previsti	[1/h]
t _a	Temperatura ambiente di lavoro	[°C]

Tipologia di configurazione richiesta:

In linea

Ortogonale

Tipologia supporto in uscita:

Freno di stazionamento:

Si

No

T _{BR}	Coppia frenante richiesta:	[Nm]
-----------------	----------------------------	------

Posizione di montaggio:

Tipologia di motore:

Idraulico

Elettrico

Endotermico

Altro

Ambiente di lavoro:

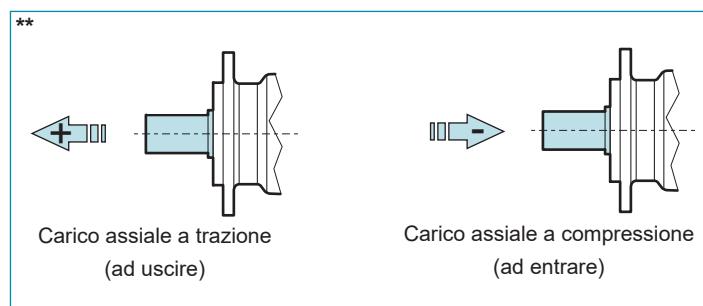

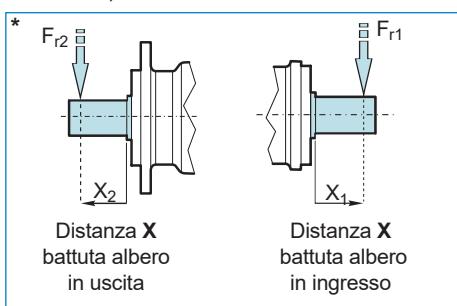

Ristretto

Grande

All'aperto

* X rappresenta la distanza fra il punto di applicazione del carico e la battuta dell'albero (vedere i diagrammi riportati nelle tabelle di selezione)

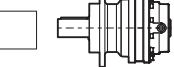

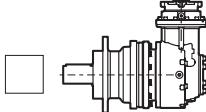

** indicare con “+” i carichi ad uscire dal riduttore e con “-” i carichi ad entrare nel riduttore.

5. SELECTING GEAR UNIT

The characteristic data of the application are required for selection of the gear unit: the following list can be used for that purpose.

Type of application:	
<i>Description</i>	<i>Value</i>
T_{2R}	Required output torque
T_{2RMAX}	Required max output torque
n_2	Output speed
n_1	Input speed
P_2	Output power
F_{rR2}	Required output shaft radial load
X_2 *	Radial load F_{rR2} application distance
F_{aR2} **	Required output shaft axial load
F_{rR1}	Required input shaft radial load
X_1 *	Radial load F_{rR1} application distance
h_R	Required duration
I	Duty cycle
N	Number of starts per hour
t_a	Work environment temperature

Type of configuration required:	
<input type="checkbox"/>	 In line
<input type="checkbox"/>	 Right-angle

Type of output support:	
<input type="checkbox"/> Parking brake:	<input type="checkbox"/> Yes <input type="checkbox"/> No

T_{BR}	Required braking torque:	[Nm]
----------	--------------------------	------

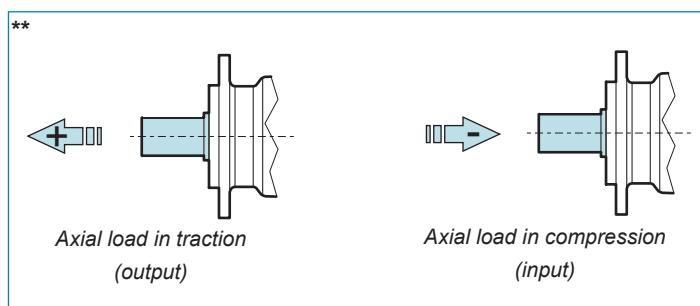

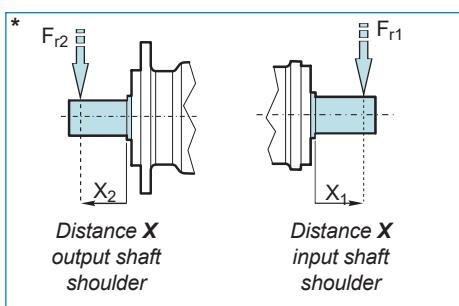

Mounting position:	
---------------------------	--

Type of motor:	
<input type="checkbox"/> Hydraulic	<input type="checkbox"/> Electric
<input type="checkbox"/> Endothermic	<input type="checkbox"/> Other

Work environment:		
<input type="checkbox"/> Limited	<input type="checkbox"/> Large	<input type="checkbox"/> Outdoor

* X is the distance between the point of load application and the shaft shoulder (see diagrams in the selection tables)

** indicate the gear unit output loads with “+” and the input loads with “-”.

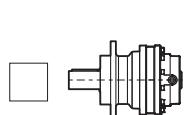

5. GETRIEBEAUSWAHL

Um ein Getriebe auswählen zu können, müssen alle charakteristischen Daten der Anwendung gesammelt werden: dazu können Sie folgende Unterlage benutzen.

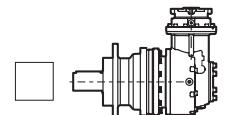

Anwendungsart:

	Beschreibung	Wert
T_{2R}	Gefordertes Abtriebsmoment	[Nm]
T_{2RMAX}	Gefordertes max. Abtriebsmoment	[Nm]
n_2	Abtriebsdrehzahl	[rpm]
n_1	Antriebsdrehzahl	[rpm]
P_2	Abtriebsleistung	[kW]
F_{rR2}	An der Abtriebswelle geforderte Radiallast	[N]
X_2^*	Distanza applicazione carico radiale F_{rR2}	[mm]
F_{aR2}^{**}	An der Abtriebswelle geforderte Radiallast	[N]
F_{rR1}	An der Antriebswelle geforderte Radiallast	[N]
X_1^*	Abstand Angriffspunkt der Radiallast F_{rR1}	[mm]
h_R	Geforderte Dauer	[h]
I	Anwendungsfaktor	[%]
N	Vorgesehene Anzahl Starts pro Stunde	[1/h]
t_a	Temperatur Arbeitsumgebung	[°C]

Geforderte Konfiguration:

Koaxialgetriebe

Winkelgetriebe

Abtriebswellen Typ:

Feststellbremse:

Ja

Nein

T_{BR} Gefordertes Bremsmoment:

[Nm]

Einbaulage:

Motortyp:

Hydraulisch

Elektrisch

Endothermisches

Anderer

Arbeitsumfeld:

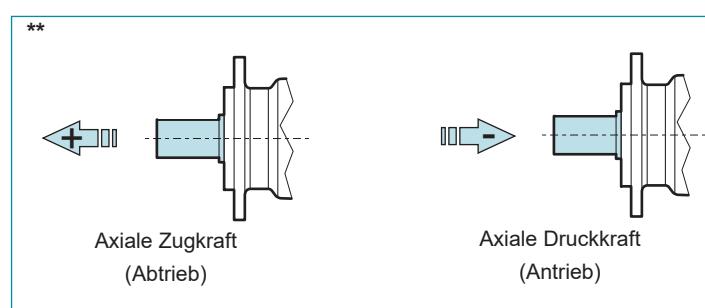

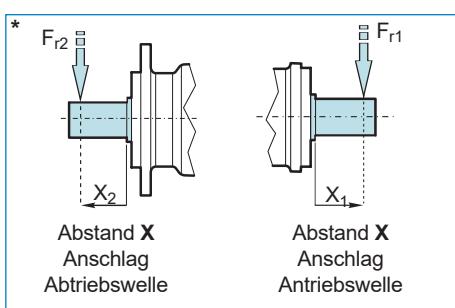

Kleiner Raum

Große Hallen

Im Freien

* X ist der Abstand zwischen dem Angriffspunkt der Last und dem Wellenanfang (siehe Diagramm in der Auswahltafel)

** mit "+" die abtriebsseitigen Lasten am Getriebe und mit "-" die antriebsseitigen Lasten am Getriebe angeben.

Procedere alla selezione come di seguito indicato:

- sulla base dell'applicazione, del tipo di azionamento e del numero di avviamenti previsti, selezionare, dalle precedenti tabelle (5) e (6), il fattore di servizio adeguato f_S ;
- dalla durata richiesta h_R e dalla velocità in uscita n_2 , calcolare il fattore di durata richiesto;

Make the selection as indicated below:

- *on the basis of the application, the type of drive and the number of starts foreseen, select the appropriate duty factor f_S from the above tables (5) and (6);*
- *from the required duration h_R and the output speed n_2 , calculate the required duration factor required;*

$$L_{h2} = n_2 \times h_R$$

(13)

- calcolare il rapporto di riduzione richiesto;

- *calculate the required reduction ratio;*

$$i = \frac{n_1}{n_2}$$

(14)

- dalle tabelle di selezione, scegliere il riduttore nella configurazione desiderata (in linea o angolare), le cui caratteristiche soddisfino alle relazioni;

- *from the selection tables, choose the gear unit in the desired configuration (in-line or angle), whose characteristics satisfy the equations;*

$$T_{2R} \times f_S \leq T_2$$

(15)

$$L_{h2} \leq n_2 \times h$$

(16)

Il riduttore prescelto dovrà avere un rapporto di riduzione il più prossimo possibile al rapporto di riduzione richiesto.

The gear unit chosen must have a reduction ratio as close as possible to that required.

Si consideri che questo tipo di selezione è adeguato quando la coppia richiesta e la velocità di rotazione sono pressoché costanti durante l'impiego: qualora si disponesse di un ciclo di impiego con carichi e velocità fortemente variabili, è necessario effettuare una selezione che consenta di individuare la taglia di riduttore più adeguata per l'applicazione. A tale fine, si consiglia di contattare il referente DANA di zona.

This type of selection is suitable when the required torque and the rotation speed are almost constant during use: for a cycle of use with highly variable loads and speeds, it is necessary to make a selection allowing the identification of a gear unit size best for the application.

Qualora sia necessario un freno lamellare in ingresso al riduttore, procedere come segue:

1. calcolare la coppia frenante richiesta T_{BR} secondo la formula (1) di pag. A11;
2. dalle tabelle di selezione dei freni (vedere capitolo "Freni lamellari a bagno d'olio"), scegliere il freno con coppia frenante T_B tale da soddisfare la relazione:

If a gear unit input multi-disc brake is necessary, proceed as follows:

1. *calculate the required braking torque T_{BR} according to the formula (1) pag. A11;*
2. *from the brake selection tables (see the section "Oil bath multi-disc brakes"), choose the brake with braking torque T_B that satisfies the equation:*

Die Getriebeauswahl wie folgt durchführen:

- je nach Anwendung, Antriebsart und der vorgesehenen Anzahl Starts den entsprechenden Betriebsfaktor f_S aus den voranstehenden Tabellen (5) und (6) entnehmen;
- anhand der geforderten Betriebsstundenzahl h_R und der Abtriebsdrehzahl n_2 , geforderten Lebensdauerfaktor berechnen;

$$T_{BR} \leq T_B$$

(17)

- gefordertes Übersetzungsverhältnis berechnen;

- aus der Auswahltafel das Getriebe in der gewünschten Konfiguration (Inline oder Winkelgetriebe) und entsprechend den Merkmalen des Übersetzungsverhältnisses auswählen;

Das gewählte Getriebe sollte ein Übersetzungsverhältnis haben, dass so weit wie möglich dem geforderten Übersetzungsverhältnis entspricht.

Als richtige Auswahl gilt, wenn das verlangte Drehmoment und die Drehzahl beim Einsatz fast konstant bleiben: bei Anwendungszyklen mit stark schwankenden Lasten und Drehzahlen ist eine Auswahl zu treffen, die es ermöglicht, die Getriebegröße zu bestimmen, die für die Anwendung am geeignetsten ist.

Wenden Sie sich an die DANA Kontakt-person der zone zu wenden.

Ist antriebsseitig am Getriebe eine Lamellenbremse notwendig, wie folgt vorgehen:

1. gefordertes Bremsmoment T_{BR} anhand der Formel (1) auf Seite A11 berechnen;
2. aus der Auswahltafel für Bremsen (siehe Kapitel „Ölbad-Lamellenbremsen“) Bremse mit dem Bremsmoment T_B auswählen, sodass folgendes Formel erfüllt ist:

6. VERIFICA DEL RIDUTTORE

Una volta effettuata la selezione del riduttore è necessario eseguire le seguenti verifiche:

- verificare che la velocità in ingresso n_1 prevista dall'applicazione risulti inferiore al valore massimo ammisible n_{1MAX} riportato nella tabella di selezione del riduttore
- verificare che la coppia massima richiesta dall'applicazione T_{2RMAX} risulti inferiore al valore di coppia massima trasmissibile T_{2MAX} riportato nella tabella di selezione del riduttore
- verificare che i carichi radiali agenti sugli alberi F_{rR1} ed F_{rR2} risultino inferiori a quelli riportati nella tabella di selezione dei supporti del riduttore. I carichi radiali sull'albero di uscita possono essere calcolati come segue:

I carichi radiali sull'albero di ingresso possono essere calcolati come segue:

Essendo T_{2R} la coppia in uscita richiesta, f_S il fattore di servizio, i il rapporto di riduzione e η_d il rendimento dinamico del riduttore.

Inoltre

- | | |
|----------|---|
| c | costante che dipende dal tipo di elemento di trasmissione montato sull'albero.
I valori della costante sono i seguenti:

$c = 1$ pignoni per catena
$c = 1.06$ ruote dentate
$c = 2$ pulegge per cinghia |
| d | diametro (mm) dell'elemento di trasmissione montato sull'albero. |

Utilizzando il valore X_2 , entrare nelle tabelle di selezione dei supporti di uscita per il riduttore selezionato, individuare il carico radiale ammmissible F_{r2} in corrispondenza di un fattore di durata $n_{2xh} \geq L_{h2}$ e verificare che si abbia:

In modo analogo, utilizzando il valore X_1 , entrare nelle tabelle di selezione dei supporti in ingresso per il riduttore selezionato, individuare il carico radiale ammmissible F_{r1} in corrispondenza di un fattore di durata $n_{1xh} \geq L_{h1}$ e verificare che si abbia:

6. VERIFICATION GEAR UNIT

After selecting the gear unit, carry out the following checks:

- check that the input speed n_1 required by the application is lower than the maximum permissible value n_{1MAX} given in the gear unit selection table
- check that the maximum torque required by the application T_{2RMAX} is lower than the maximum permissible torque value T_{2MAX} given in the gear unit selection table
- check that the radial loads acting on the shafts F_{rR1} and F_{rR2} are lower than those given in the gear unit support selection table. The radial loads on the output shaft can be calculated as follows:

$$F_{rR2} = \frac{2'000 \times T_{2R} \times f_S \times c}{d} \quad [N]$$

The radial loads on the input shaft can be calculated as follows:

$$F_{rR1} = \frac{2'000 \times T_{2R} \times f_S \times c}{d \times i \times \eta_d} \quad [N]$$

T_{2R} being the required output torque, f_S the duty factor, i the reduction ratio and η_d the dynamic efficiency of the gear unit.

Also

- | | |
|----------|---|
| c | constant that depends on the type of transmission element mounted on the shaft.
The values of the constant are:

$c = 1$ pinions for chain
$c = 1.06$ gear wheels
$c = 2$ pulleys for belt |
| d | diameter (mm) of the transmission element mounted on the shaft. |

Using the value X_2 , enter the selection tables of the output supports for the selected gear unit, locate the permissible radial load F_{r2} at a duration factor $n_{2xh} \geq L_{h2}$ and check:

$$F_{rR2} \leq F_{r2}$$

Similarly, using the value X_1 , enter the selection tables of the input supports for the selected gear unit, locate the permissible radial load F_{r1} at a duration factor $n_{1xh} \geq L_{h1}$ and check:

$$F_{rR1} \leq F_{r1}$$

6. GETRIEBEAUSWAHL

Nach der Auswahl des Getriebes müssen folgende Prüfungen vorgenommen werden:

- Antriebsdrehzahl n_1 prüfen, ob sie unter dem maximal zulässigen Wert n_{1MAX} der Auswahltafel des Getriebes liegt
- prüfen ob das von der Anwendung geforderte maximale Drehmoment T_{2RMAX} unter dem Wert für das maximal übertragbare Moment T_{2MAX} in der Auswahltafel des Getriebes liegt
- prüfen ob die auf die Wellen F_{rR1} und F_{rR2} wirkenden Radiallasten unterhalb denen liegen, die in der Auswahltafel für die Wellen aufgeführt sind. Die Radiallasten der Abtriebswelle können wie folgt berechnet werden:

(18)

Die Radiallasten der Abtriebswelle können wie folgt berechnet werden:

(19)

Dabei ist T_{2R} das verlangte Abtriebsdrehmoment, f_S der Betriebsfaktor, i das Übersetzungsverhältnis und η_d der dynamische Wirkungsgrad des Getriebes.
Drüber hinaus

- | | |
|----------|---|
| c | Konstante, in Abhängigkeit vom auf der Welle montierten Antriebselement.
Die Werte der Konstante sind:

$c = 1$ Kettenritzel
$c = 1.06$ Zahnräder
$c = 2$ Riemenscheiben |
| d | Durchmesser (mm) des auf der Welle montierten Antriebselements. |

In der Tabelle für die Auswahl der Abtriebswelle des gewählten Getriebes anhand des Wertes X_2 die zulässige Radiallast F_{r2} für einen Lebensdauer von Lauerfaktor $n_{2xh} \geq L_{h2}$ ermitteln und überprüfen, dass:

(20)

Auf die gleiche Weise in der Tabelle für die Auswahl der Antriebswelle des gewählten Getriebes anhand des Wertes X_1 die zulässige Radiallast F_{r1} für einen Lebensdauer von Lauerfaktor $n_{1xh} \geq L_{h1}$ ermitteln und überprüfen, dass:

(21)

- verificare che i carichi assiali agenti sugli alberi in uscita F_{aR2} risultino inferiori a quelli riportati nelle tabelle di selezione dei supporti in uscita. A tale scopo, entrare nelle tabelle di selezione dei supporti per il riduttore selezionato, individuare il carico assiale ammissibile F_{a2} in corrispondenza di un fattore di durata $n_2xh \geq L_{h2}$ e verificare che si abbia:

- check that the axial loads on the output shafts F_{aR2} are lower than those given in the output support selection tables. Enter the selection tables of supports for the selected gear unit, and identify the permissible axial load F_{a2} at a duration factor $n_2xh \geq L_{h2}$ and check:*

$$F_{aR2} \leq F_{a2}$$

(22)

Qualora i carichi radiali e assiali presentino significative variazioni durante l'impiego, oppure l'applicazione sia caratterizzata da numerose inversioni del moto, contattare il referente DANA di zona, per una verifica più approfondita.

Tenere in considerazione le raccomandazioni riportate al paragrafo "Carichi assiali ammissibili sugli alberi in uscita" (pag. A22).

- Verificare che la potenza applicata P_1 risulti sempre inferiore alla potenza termica corretta P_{T1} secondo quanto indicato dalla formula (8). Nel caso in cui la potenza termica corretta del riduttore risulti inferiore alla potenza da trasmettere, anche solo in una condizione dell'eventuale ciclo di impiego, occorre prevedere la presenza di un circuito ausiliario di raffreddamento. Per la selezione di tale circuito, si prega di contattare il referente DANA di zona.

Qualora, per il riduttore in oggetto, sia stato selezionato un freno in ingresso è necessario verificare che la coppia frenante calcolata in uscita al riduttore risulti inferiore alla coppia massima in uscita T_{2MAX} trasmissibile dal riduttore:

- calcolare la coppia frenante in uscita al riduttore
- verificare che si abbia

If the radial and axial loads show significant variations during use, or the application is characterized by numerous reversals, consult the DANA area contact person for a more thorough check.

Take into account the recommendations given in the section "Permissible loads on output shafts" (pag. A22).

- Check that the applied power P_1 is always lower than the corrected thermal power P_{T1} as indicated by the formula (8). If the corrected thermal power of the gear unit is less than the power to be transmitted, even in just one condition of the possible operating cycle, an auxiliary cooling circuit must be provided.*

For the selection of this circuit, please consult the DANA area contact person.

If an input brake has been selected for the gear unit in question, it is necessary to check that the calculated gear unit output braking torque is less than the maximum output torque T_{2MAX} transmissible by the gear unit:

- calculate the gear unit output braking torque*

$$T_{2B} = T_B \times i \quad [\text{Nm}]$$

(23)

$$T_{2B} \leq T_{2MAX}$$

(24)

7. SCELTA DEL MOTORE

In questa sezione vengono fornite alcune indicazioni di massima utili alla selezione del motore per l'azionamento del riduttore.

Motore idraulico

Sulla base dell'applicazione, scegliere il tipo di motore più adeguato secondo la tabella seguente. I valori riportati sono indicativi

7. CHOICE OF MOTOR

This section provides some general information useful for selecting the gear unit drive motor.

Hydraulic motor

Based on the application, choose the most appropriate type of motor according to the following table. The values are only a guide

- die auf die Wellen F_{rR2} wirkenden Radiallasten unter denen liegen, die in der Auswahltabelle für Abtriebswellen aufgeführt sind. Zu diesem Zweck in der Tabelle für die Auswahl der Wellen des gewählten Getriebes die zulässige Axiallast F_{r2} für einen Lebensdauer von Lauerfaktor $n_2xh \geq L_{h2}$ ermitteln und überprüfen, dass:

Ergeben sich im Betrieb größere Schwingungen bei den Radial- und Axiallasten oder beim Betrieb werden zahlreiche Drehrichtungsänderungen ausgeführt bitten wir, für eine tiefgreifende Überprüfung Kontakt mit dem Technischen Vertriebsniedienst von Bevini aufzunehmen. Beachten Sie die Empfehlung im Abschnitt „Zulässige Axiallasten an den Abtriebswellen“ (Seite A22).

- Sicherstellen, dass die angelegte Last P_1 immer unter der korrigierten Wärmeleistung P_{T1} entsprechend der Formel (8) liegt. Falls die korrigierte Wärmeleistung des Getriebes niedriger als die zu übertragende Leistung ist, selbst in einer einzigen Bedingung des Zyklus, muss ein zusätzliches Kühlsystem installiert werden.

Für die Auswahl eines solchen Kühlkreises wenden Sie sich an die DANA Kontaktperson der zone zu wenden.

Wurde für das betreffende Getriebe eine antriebsseitige Bremse gewählt muss überprüft werden, dass das berechnete Bremsmoment abtriebsseitig des Getriebes niedriger als das maximal übertragbare Abtriebsdrehmoment T_{2MAX} des Getriebes liegt:

- Berechnung des abtriebsseitigen Bremsmoments

7. MOTORAUSWAHL

In diesem Abschnitt werden einige Höchstangaben gemacht, die bei der Auswahl des Motors zum Antrieb des Getriebes hilfreich sind.

Hydraulikmotor

Je nach Anwendung den am besten geeigneten Motor aus folgender Tabelle auswählen. Die angegebenen Werte sind Richtwerte

Tipo di applicazione <i>Type of application</i> Anwendungsart	Leggero <i>Light</i> Leicht	Medio <i>Medium</i> Mittel	Pesante <i>Heavy</i> Schwer
Pressione d'esercizio <i>Operating pressure</i> Betriebsdruck p_A [bar]	< 175	175 - 250	250 - 450
Tipologia di motore <i>Type of motor</i> Motortyp	Orbitale <i>Orbital</i> Orbital	A ingranaggi <i>Gear</i> Mit Getriebe	A pistoni radiali <i>Radial piston</i> Mit Radialkolben
Velocità <i>Speed</i> Drehzahl n_1 [rpm]	< 700	< 3'000	< 500
Rendimento meccanico <i>Mechanical efficiency</i> Mechanischer Wirkungsgrad η_{mh}	0.80	0.85	0.95
Rendimento volumetrico <i>Volumetric efficiency</i> Volumetrischer Wirkungsgrad η_v	0.90	0.87	0.95

Tab. (7)

Determinare la coppia richiesta in ingresso al riduttore con la formula:

Determine the required gear unit input torque with the formula:

Berechnung des antriebsseitig geforderten Drehmoments nach der Formel:

$$T_{1R} = \frac{T_{2R}}{i \times \eta_d} \quad [\text{Nm}] \quad (25)$$

In cui T_{2R} rappresenta la coppia in uscita richiesta, i il rapporto di riduzione e η_d il rendimento dinamico del riduttore (tab. 4).

Calcolare la cilindrata teorica richiesta per il motore idraulico con la seguente formula:

Where T_{2R} is the required output torque, i the reduction ratio and η_d is the dynamic efficiency of the gear unit (table 4).

Calculate the theoretical displacement required for the hydraulic motor with the following formula:

Dabei ist T_{2R} Das abtriebsseitig geforderte Drehmoment, i das Übersetzungverhältnis und η_d der dynamische Wirkungsgrad des Getriebes (Tab. 4).

Berechnung des geforderten theoretischen Hubraums des Hydraulikmotors mit folgender Formel:

$$V_R = \frac{62.8 \times T_{1R}}{p_A \times \eta_{mh}} \quad [\text{cm}^3] \quad (26)$$

in cui η_{mh} rappresenta il rendimento meccanico del motore idraulico prescelto (tab. 7) e p_A rappresenta la pressione d'esercizio del motore. La cilindrata effettiva del motore V dovrà essere tale per cui:

where η_{mh} is the mechanical efficiency of the selected hydraulic motor (table 7) and p_A is the operating pressure of the motor. The actual displacement of the motor V must be such that:

dabei ist η_{mh} der mechanische Wirkungsgrad des ausgewählten (Tab. 7) Hydraulikmotors und p_A der Betriebsdruck des Motors. Das ist der effektive Hubraum des V Motors daher:

$$V_R \leq V \quad (27)$$

Calcolare infine la portata q necessaria per l'alimentazione del motore:

Lastly, calculate the required flow q for the motor feed:

Schließlich ist der Volumenstrom q zur Versorgung des Motors zu berechnen:

$$q = \frac{V \times n_1}{1'000 \times \eta_v} \quad [\text{l/min}] \quad (28)$$

essendo n_1 la velocità in ingresso del riduttore e η_v il rendimento volumetrico del motore prescelto (tab. 7).

Consultare il catalogo DANA, oppure le schede tecniche degli altri costruttori per la scelta finale del motore.

Motore elettrico

Calcolare la potenza in ingresso al riduttore tramite la formula:

Essendo P_2 la potenza in uscita e η_d il rendimento dinamico del riduttore prescelto (tab.4).

Dalle tabelle dati tecnici dei costruttori di motori elettrici, selezionare un motore la cui potenza nominale P_n sia tale per cui:

La potenza P_n , se non diversamente specificato, si riferisce al servizio continuo S1. Qualora le condizioni di impiego dei motori siano diverse da S1, è necessario individuare il tipo di servizio corrispondente secondo le normative CEI EN 60034-1 (CEI 2-3)/IEC 34-1.

Per i servizi S2 e S3, per motori di grandezza inferiore o uguale a 132, è possibile ottenere un incremento di potenza rispetto al servizio continuo S1, secondo un opportuno fattore f_I .

Il fattore di incremento della potenza f_I può essere ricavato dalla tabella seguente:

Tipo di servizio / Type of duty / Betriebsart								
S2				S3				
Durata del ciclo / Cycle duration / Zyklusdauer [min]				Fattore d'intermittenza I / Duty cycle I / Anwendungsfaktor [%]				
	10	30	60	90	15%	25%	40%	60%
f_I	1.4	1.2	1.1	1.05	1.4	1.25	1.13	1.07

Tab. (8)

Per la definizione del fattore di intermittenza I, fare riferimento alla formula (6) di pag. A13.

Nel caso di servizi S2 e S3, selezionare quindi un motore elettrico la cui potenza nominale P_n sia tale da soddisfare la seguente relazione:

n_1 being the gear unit input speed and η_v the volumetric efficiency of the chosen motor (table 7).

Refer to the DANA catalog, or the technical data sheets of other manufacturers for the final choice of motor.

es gilt: n_1 ist die Antriebsgeschwindigkeit des Getriebes und η_v der volumetrische Wirkungsgrad des ausgewählten Motors (Tab. 7).

Für die endgültige Auswahl des Motors DANA Katalog einsehen oder die technischen Datenblätter anderer Hersteller.

Electric motor

Calculate the gear unit input power with the formula:

$$P_1 = \frac{P_2}{\eta_d} \quad [\text{kW}]$$

(29)

P_2 being the output power and η_d the dynamic efficiency of the chosen gear unit (table 4).

From the technical data tables of the manufacturers of electric motors, select a motor whose nominal power P_n is such that:

$$P_1 \leq P_n$$

(30)

Unless otherwise specified, the power P_n refers to continuous duty S1. If the operating conditions of the motors are different from S1, it is necessary to identify the corresponding type of duty according to standards CEI EN 60034-1 (CEI 2-3)/IEC 34-1.

For S2 and S3, for motor sizes smaller than or equal to 132, it is possible to obtain a power increase with respect to continuous duty S1, according to a suitable factor f_I .

The power increase factor f_I can be obtained from the following table:

Dabei ist P_2 die Abtriebsleistung und η_d der dynamische Wirkungsgrad des ausgewählten Getriebes (Tab. 4).

Entsprechend den Datenblättern der Hersteller der Elektromotoren einen Motor mit der Nennleistung P_n auswählen, daher ergibt sich:

Die Leistung P_n , wenn nicht anders angegeben, bezieht sich auf einen kontinuierlichen Betrieb S1. Sind die Einsatzbedingungen der Motore anders als S1, muss die entsprechende Art des Betriebs anhand der Norm CEI EN 60034-1 (CEI 2-3)/IEC 34-1 bestimmt werden.

Für den Betrieb S2 und S3 ist es möglich, bei Motorgrößen kleiner oder gleich 132 eine Leistungssteigerung mit Faktor f_I gegenüber Dauerbetrieb S1 zu bekommen.

Der Leistungssteigerungsfaktor f_I kann aus folgender Tabelle entnommen werden:

$$P_1 \leq P_n \times f_I$$

(31)

In the case of S2 and S3, select an electric motor whose nominal power P_n is such as to satisfy the following equation:

Bei den Betriebsarten S2 und S3 ist demzufolge ein Elektromotor mit einer Nennleistung P_n auszuwählen, entsprechend folgender Formel:

8. ESEMPIO DI SELEZIONE DEL RIDUTTORE

Si deve selezionare un riduttore per la seguente applicazione:

Tipologia di applicazione:		Convogliatore non uniformemente alimentato	
	Descrizione	Valore	
T _{2R}	Coppia richiesta in uscita	5'500	[Nm]
T _{2RMAX}	Coppia massima richiesta in uscita	10'000	[Nm]
n ₂	Velocità in uscita	12	[rpm]
n ₁	Velocità in ingresso	1'500	[rpm]
P ₂	Potenza in uscita	-	[kW]
F _{rR2}	Carico radiale richiesto sull'albero in uscita	40'000	[N]
X ₂	Distanza applicazione carico radiale F _{rR2}	40	[mm]
F _{aR2}	Carico assiale richiesto sull'albero in uscita	-	[N]
F _{rR1}	Carico radiale richiesto sull'albero in ingresso	-	[N]
X ₁	Distanza applicazione carico radiale F _{rR1}	-	[mm]
h _R	Durata richiesta	25'000	[h]
I	Fattore d'intermittenza	100	[%]
N	Numero di avviamenti orari previsti	3	[1/h]
t _a	Temperatura ambiente di lavoro	20	[°C]

Tipologia di configurazione richiesta:	<input checked="" type="checkbox"/> In linea	<input type="checkbox"/> Ortagonale
--	--	-------------------------------------

Tipologia supporto in uscita:	Albero maschio scanalato		
Freno di stazionamento:	<input type="checkbox"/> Si	<input checked="" type="checkbox"/> No	
T _{BR}	Coppia frenante richiesta:		[Nm]

Posizione di montaggio:	Orizzontale		
-------------------------	--------------------	--	--

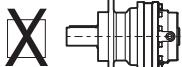

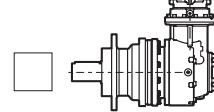

Tipologia di motore:	<input type="checkbox"/> Idraulico	<input checked="" type="checkbox"/> Elettrico	<input type="checkbox"/> Endotermico	<input type="checkbox"/> Altro
----------------------	------------------------------------	---	--------------------------------------	--------------------------------

Ambiente di lavoro:	<input type="checkbox"/> Ristretto	<input checked="" type="checkbox"/> Grande	<input type="checkbox"/> All'aperto
---------------------	------------------------------------	--	-------------------------------------

8. EXAMPLE OF GEAR UNIT SELECTION

A gear unit must be selected for the following application:

Type of application: Conveyor not uniformly fed			
	Description	Value	
T_{2R}	Required output torque	5'500	[Nm]
T_{2RMAX}	Required max output torque	10'000	[Nm]
n_2	Output speed	12	[rpm]
n_1	Input speed	1'500	[rpm]
P_2	Output power	-	[kW]
F_{rR2}	Required output shaft radial load	40'000	[N]
X_2^*	Radial load F_{rR2} application distance	40	[mm]
F_{aR2}^{**}	Required output shaft axial load	-	[N]
F_{rR1}	Required input shaft radial load	-	[N]
X_1^*	Radial load F_{rR1} application distance	-	[mm]
h_R	Required duration	25'000	[h]
I	Duty cycle	100	[%]
N	Number of starts per hour	3	[1/h]
t_a	Work environment temperature	20	[°C]

Type of configuration required:		
	<i>In line</i>	<i>Right-angle</i>

Type of output support: Male splined shaft	<input type="checkbox"/> Yes	<input checked="" type="checkbox"/> No
---	------------------------------	--

Parking brake:	<input type="checkbox"/>	
-----------------------	--------------------------	--

T_{BR}	Required braking torque:		[Nm]
----------	--------------------------	--	------

Mounting position: Horizontal	
--------------------------------------	--

Type of motor:	<input type="checkbox"/> Hydraulic	<input checked="" type="checkbox"/> Electric	<input type="checkbox"/> Endothermic	<input type="checkbox"/> Other
-----------------------	------------------------------------	--	--------------------------------------	--------------------------------

Work environment:	<input type="checkbox"/> Limited	<input checked="" type="checkbox"/> Large	<input type="checkbox"/> Outdoor
--------------------------	----------------------------------	---	----------------------------------

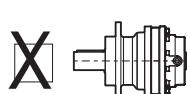

8. BEISPIEL FÜR GETRIEBEAUSWAHL

Es soll ein Getriebe für die nachstehende Anwendung ausgewählt werden:

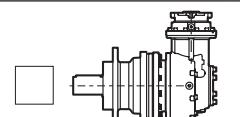

Anwendungsart: Ungleichmäßig beschickter Förderer

	Beschreibung	Wert	
T_{2R}	Gefordertes Abtriebsmoment	5'500	[Nm]
T_{2RMAX}	Gefordertes max. Abtriebsmoment	10'000	[Nm]
n_2	Abtriebsdrehzahl	12	[rpm]
n_1	Antriebsdrehzahl	1'500	[rpm]
P_2	Abtriebsleistung	-	[kW]
F_{rR2}	An der Abtriebswelle geforderte Radiallast	40'000	[N]
X_2^*	Distanza applicazione carico radiale F_{rR2}	40	[mm]
F_{aR2}^{**}	An der Abtriebswelle geforderte Radiallast	-	[N]
F_{rR1}	An der Antriebswelle geforderte Radiallast	-	[N]
X_1^*	Abstand Angriffspunkt der Radiallast F_{rR1}	-	[mm]
h_R	Geforderte Dauer	25'000	[h]
I	Anwendungsfaktor	100	[%]
N	Vorgesehene Anzahl Starts pro Stunde	3	[1/h]
t_a	Temperatur Arbeitsumgebung	20	[°C]

Geforderte Konfiguration:

Koaxialgetriebe

Winkelgetriebe

Abtriebswellen Typ: **Wellenstumpf mit Keilnut**

Feststellbremse:

Ja

Nein

T_{BR} Gefordertes Bremsmoment:

[Nm]

Einbaulage: **Waagerecht**

Motortyp:

Hydraulisch

Elektrisch

Endothermisch

Anderer

Arbeitsumfeld:

Kleiner Raum

Große Hallen

Im Freien

Selezione del riduttore

Si calcola il fattore di durata L_{h2} secondo la formula (12):

Gear unit selection

Calculates the lifetime factor L_{h2} according to the formula (12):

Getriebeauswahl

Man berechnet den Lebensdauerfaktor L_{h2} nach der folgenden Formel (12):

$$L_{h2} = 12 \times 25'000 = 300'000$$

Si calcola il rapporto di riduzione richiesto secondo la formula (3)

Calculate the required reduction ratio according to the formula (3)

Man berechnet das Übersetzungsverhältnis nach folgender Formel (3)

$$i = \frac{1'500}{12} = 125$$

Dalla tabella (6), per "Convogliatori non uniformemente alimentati", si ricava la "Natura del carico", che in questo caso è "b".

Successivamente, dalla tabella (5), utilizzando la natura del carico "b", il numero di avviamenti/ora $N < 16$ e la tipologia di motore "elettrico", si ottiene il fattore di servizio, $f_s = 1.10$

Dalle tabelle di selezione, si sceglie il riduttore nella configurazione in linea le cui caratteristiche soddisfano le relazioni (15) e (16):

From the table (6), for "Conveyors not uniformly fed", the "Nature of load" is obtained, which in this case is "b".

Then, from the table (5), using the nature of the load "b", the number of starts/hour $N < 16$ and the type of "electric" motor, the duty factor $f_s = 1.10$ is obtained

From the selection tables, choose the gear unit in the in-line configuration whose characteristics satisfy the equations (15) and (16):

Aus der Tabelle(6), für "Förderer mit nicht uniformer Beschickung", entnimmt man die "Lastart", in diesem Fall ist das "b".

Dann erhält man aus der Tabelle (5) unter Verwendung von der Lastart "b", die Anzahl der Starts/Stunde $N < 16$ und der Motorart "elektrisch" den Betriebsfaktor $f_s = 1.10$

Aus der Auswahltafel wählt man das Getriebe mit In-Line-Konfiguration dessen Eigenschaften den Verhältnissen (15) und (16) entsprechen:

$$T_{2R} \times f_s = 5'500 \times 1.1 = 6'050 \text{ Nm} \rightarrow 6'050 \leq T_2$$

$$L_{h2} = 300'000 \rightarrow 300'000 \leq n_{2xh}$$

Il riduttore prescelto dovrà inoltre avere un rapporto di riduzione il più prossimo possibile a $i = 125$ precedentemente calcolato.

The chosen gear unit should also have a reduction ratio as close as possible to $i = 125$ previously calculated.

Das gewählte Getriebe sollte darüber hinaus ein Übersetzungsverhältnis haben, dass so weit wie möglich dem vorher berechneten Übersetzungsverhältnis $i = 125$ entspricht.

Dalla tabella (9), si individua la grandezza del riduttore con coppia nominale T_{2N} immediatamente superiore al valore precedentemente calcolato $T_{2R} \times f_s = 6'050 \text{ Nm}$:

From the table (9), identify the size of the gear unit with nominal torque T_{2N} immediately higher than the value previously calculated $T_{2R} \times f_s = 6'050 \text{ Nm}$:

Aus der Tabelle (9) entnimmt man die Größe des Getriebes mit dem Nennmoment T_{2N} gleich über dem Wert, der vorher berechnet wurde $T_{2R} \times f_s = 6'050 \text{ Nm}$:

Grandezza Size Größe	$T_{2N} [\text{Nm}]$								
	1'200	1'800	2'900	3'800	5'000	8'500	13'000	18'000	26'000
E10	E16	E25	E30	E50	E80	E120	E160	E260	

Tab. (9)

Tali valori sono riportati per tutte le grandezze, nella tabella riepilogativa tab.(14) al termine della sezione A (pag.A43).

These values are given for all sizes, in the summary table (14) at the end of section A (page A43).

Diese Werte finden sich für alle Größen in der Übersichtstabelle (14) am Ende von Abschnitt A (S. A43).

Si considera quindi la grandezza **E80** e la relativa tabella delle prestazioni conforme alla tipologia prescelta di riduttore (nel presente caso in linea → **EL80**).

Dalla colonna **i**, individuare il rapporto di riduzione più prossimo a quello richiesto **i = 125**, precedentemente calcolato:

Therefore consider the size **E80** and the relevant performance table according to the selected type of gear unit (in this case in line → **EL80**).

From the column **i**, identify the reduction ratio closest to the required **i = 125**, previously calculated:

Man sieht also die Größe **E80** in Betracht und die entsprechende Tabelle für die Leistungen für den ausgewählten Getriebetyp (im vorliegenden Fall In-Line → **EL80**).

Aus der Spalte **i**, das Übersetzungsverhältnis wählen, dass dem geforderten Verhältnis von **i = 125**, am nächsten kommt, das vorher berechnet wurde:

i	T₂ [Nm]					n₂ x h 500'000	n₂ x h 1'000'000	n_{1MAX} [rpm]	T_{2MAX} [Nm]	P_t [kW]
	n₂ x h 10'000	n₂ x h 25'000	n₂ x h 50'000	n₂ x h 100'000

Tab. (10)

Si identifica quindi la colonna relativa al valore **n₂xh** immediatamente superiore a quello precedentemente calcolato di **L_{h2} = 300'000**.

Nel caso in esame si considera quindi la colonna **n₂xh = 500'000 ≥ 300'000** (in accordo alla relazione (16)) e si verifica che la coppia trasmissibile **T₂** sia superiore alla coppia richiesta **T_{2R} × f_S = 6'050 Nm** precedentemente calcolata (in accordo alla formula (15)).

Dalla tabella delle prestazioni si legge un valore di **T₂ = 6'800 ≥ 6'050 Nm** confermando l'idoneità del riduttore prescelto a lavorare alle condizioni richieste.

Il riduttore prescelto è quindi del tipo in linea a tre stadi di riduzione **EL803** con rapporto di riduzione **i = 119**.

Then identify the column relevant to the value **n₂xh** immediately higher than the previously calculated **L_{h2} = 300'000**.

In the present case, consider the column **n₂xh = 500'000 ≥ 300'000** (according to the equation (16)) and note that the transmissible torque **T₂** is higher than the required torque **T_{2R} × f_S = 6'050 Nm** previously calculated (according to the formula (15)).

The performance table gives a value of **T₂ = 6'800 ≥ 6'050 Nm** confirming the suitability of the chosen gear unit to work at the required conditions.

The chosen gear unit is therefore the in-line type with three reduction stages **EL803** with reduction ratio **i = 119**.

Man sucht nach der Spalte für den Wert **n₂xh**, der direkt über dem vorher berechnete Wert **L_{h2} = 300'000** liegt.

Im vorliegenden Fall berücksichtigt man also die Spalte **n₂xh = 500'000 ≥ 300'000** (Entsprechend dem Verhältnis (16)) und man überprüft, ob das übertragbare Drehmoment **T₂** über dem geforderten Drehmoment **T_{2R} × f_S = 6'050 Nm** liegt, das vorher berechnet wurde (entsprechend der Formel (15)).

In der Leistungstabelle findet man den Wert **T₂ = 6'800 ≥ 6'050 Nm**, der bestätigt, dass das vorher ausgewählte Getriebe für den Einsatz unter den geforderten Bedingungen geeignet ist.

Das vor gewählte Getriebe ist also vom Typ In-Line, hat drei Übersetzungsstufen **EL803** mit einem Übersetzungsverhältnis **i = 119**.

Verifica della coppia massima

Dalla tabella delle prestazioni, si ricava per il riduttore selezionato EL803 con rapporto di riduzione $i = 119$, una coppia massima trasmissibile $T_{2MAX} = 12\,500 \text{ Nm}$.

Tale valore è superiore a quello massimo richiesto dall'applicazione T_{2RMAX} , che è di $10\,000 \text{ Nm}$. Il riduttore selezionato è quindi adeguato a trasmettere la coppia massima richiesta.

Verifica dei carichi sugli alberi

Dalle tabelle dei supporti in uscita di tipo "Albero maschio scanalato" per la taglia E80 (vedi pag. E⁸⁰), si evidenzia che esistono due tipologie di supporto maschio disponibili:

- MP
- MP090

Si supponga che il tipo MP sia quello selezionato.

Utilizzando la distanza $X_2 = 40 \text{ mm}$ (come riportata nei dati iniziali di pag. A31), si entra nel diagramma dei carichi radiali per la tipologia di uscita prescelta (MP) sino ad intersecare la curva relativa al valore $n_{2xh} = 500\,000$ (precedentemente individuato e soddisfacente la $n_{2xh} \geq L_{h2} = 300\,000$).

Da tale curva, sull'asse delle ordinate, si ricava il valore del carico radiale ammisible che risulta essere $F_{r2} = 52\,000 \text{ N}$.

Check of maximum torque

From the performance table, a maximum transmissible torque $T_{2MAX} = 12\,500 \text{ Nm}$ is obtained for the selected gear unit EL803 with reduction ratio $i = 119$.

This value is higher than the maximum required by the application T_{2RMAX} , which is $10\,000 \text{ Nm}$.

The selected gear unit is therefore suitable to transmit the required maximum torque.

Überprüfung des maximalen Drehmoments

Aus der Leistungstabelle ergibt sich für das ausgewählte Getriebe EL803 bei einem Übersetzungsverhältnis $i = 119$, ein maximal übertragbares Drehmoment $T_{2MAX} = 12\,500 \text{ Nm}$.

Dieser Wert liegt höher als der geforderte Höchstwert bei der Anwendung T_{2RMAX} von $10\,000 \text{ Nm}$.

Das ausgewählte Getriebe eignet sich demzufolge für die Übertragung des geforderten max. Drehmoments.

Check of loads on shafts

The tables of "Male splined shaft" type output supports for size E80 (see page E⁸⁰), show that two types of male support are available:

- MP
- MP090

Assuming the MP type is selected.

Using the distance $X_2 = 40 \text{ mm}$ (as given in the initial data p. A32), enter the diagram of radial loads for the type of output chosen (MP) until intersecting the curve relevant to the value $n_{2xh} = 500\,000$ (previously identified and satisfying $n_{2xh} \geq L_{h2} = 300\,000$).

From this curve, on the axis of ordinates, the permissible radial load value is obtained, which is $F_{r2} = 52\,000 \text{ N}$.

Überprüfung der Wellenlasten

Aus den Tabelle der Abtriebswellen vom Typ "Wellenstupf" für die Größe E80 (Siehe S. E⁸⁰), ergeben sich zwei Arten von Wellenstüpfen:

- MP
- MP090

Wir nehmen an, dass Typ MP ausgewählt wurde.

Anhand des Abstands $X_2 = 40 \text{ mm}$ (entsprechend den Ausgangsdaten S. A33), sucht man im Radiallast-Diagramm für den ausgewählten Typ der Abtriebswelle (MP) den Schnittpunkt der Kurve mit dem Wert $n_{2xh} = 500\,000$ (vorher bestimmt und passend für $n_{2xh} \geq L_{h2} = 300\,000$).

Anhand dieser Kurve entnimmt man am Schnittpunkt mit der zulässigen Radiallast den Wert $F_{r2} = 52\,000 \text{ N}$.

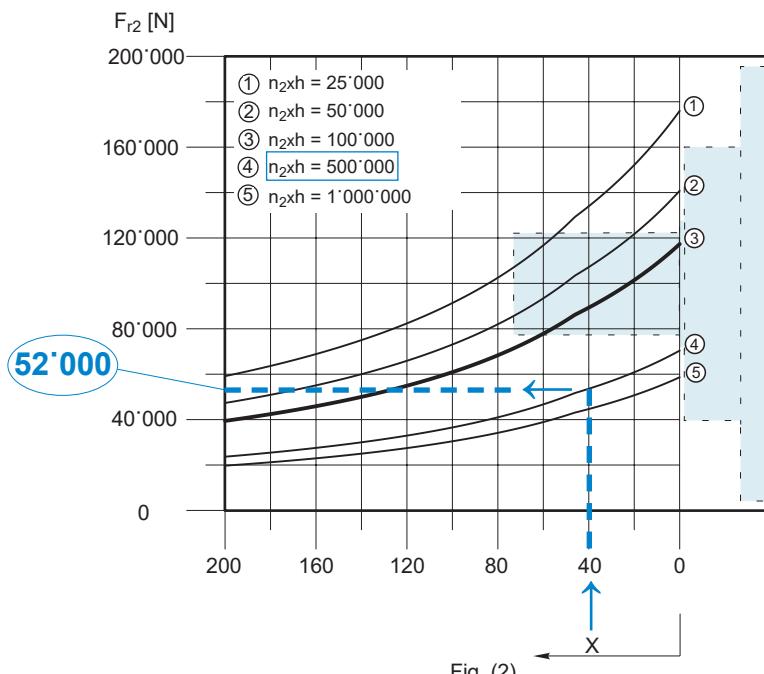

Fig. (2)

Per fattori di durata $n_{2xh} < 25\,000$ cicli, contattare il referente DANA di zona.

For duration factor $n_{2xh} < 25\,000$ cycles, please consult the DANA area contact person.

Für Lebensdauerfaktoren $n_{2xh} < 25\,000$ arbeitszyklen, bitte sich an die DANA Kontaktperson der zone zu wenden.

Poiché il valore del carico radiale ammisible appena definito F_{r2} , risulta essere maggiore del carico radiale richiesto F_{rR2} in accordo alla formula (20), il supporto selezionato è idoneo ad operare nelle condizioni richieste.

Since the permissible radial load value just defined F_{r2} , is greater than the required radial load F_{rR2} according to the formula (20), the selected support is suitable to operate in the required conditions.

$$F_{rR2} = 40\,000 \text{ N} < F_{r2} = 52\,000 \text{ N}$$

Verifica della potenza termica

Dalla formula (5), è possibile calcolare la potenza trasmessa in uscita:

Check of thermal power

From the formula (5), it is possible to calculate the transmitted output power:

$$P_2 = \frac{5\cdot500 \times 12}{9\cdot550} = 6.9 \text{ kW}$$

Dalla formula (4), considerando il rendimento dinamico $\eta_d = 0.94$ del riduttore EL803, ricavato dalla tabella (4), è possibile calcolare la potenza applicata in ingresso al riduttore:

From the formula (4), assuming the dynamic efficiency $\eta_d = 0.94$ of the gear unit EL803, obtained from the table (4), it is possible to calculate the gear unit input power applied:

$$P_1 = \frac{6.9}{0.94} = 7.4 \text{ kW}$$

Dalla tabella dei dati di selezione, per il riduttore EL803 selezionato, si ha una potenza termica dissipabile pari a $P_T = 8.0 \text{ kW}$.

Dalla tabella (1) di pag. A13, considerando un fattore d'intermittenza $I = 100 \%$ ed una temperatura ambiente di 20°C (come riportato nei dati iniziali di pag. A31), si ottiene un fattore termico $f_K = 1.0$.

Con velocità in ingresso $n_1 = 1\,500 \text{ rpm}$ e posizione di montaggio orizzontale, dalla tabella (2) si ottiene un fattore di velocità $f_V = 1.0$.

Infine, dalla tabella (3), per ambiente di lavoro "grande", si ottiene un fattore ambiente $f_R = 1.0$.

Secondo la formula (7), la potenza termica corretta risulterà essere pari a:

A dissipatable thermal power equal to $P_T = 8.0 \text{ kW}$ is obtained from the table of selection data, for the selected gear unit EL803.

Assuming a duty cycle $I = 100 \%$ and an ambient temperature of 20°C (as given in the initial data p. A32), a thermal factor $f_K = 1.0$ is obtained from the table (1) p. A13.

With input speed $n_1 = 1\,500 \text{ rpm}$ and horizontal mounting position, a speed factor $f_V = 1.0$ is obtained from the table (2).

Lastly, for a "large" work environment, an environmental factor $f_R = 1.0$ is obtained from the table (3).

According to the formula (7), the corrected thermal power is equal to:

$$P_{T1} = 8 \times 1.0 \times 1.0 \times 1.0 = 8.0 \text{ kW}$$

La potenza applicata P_1 risulta essere inferiore alla potenza termica corretta P_{T1} , secondo la formula (8):

The applied power P_1 is lower than the corrected thermal power P_{T1} , according to the formula (8):

$$P_1 = 7.4 \text{ kW} \leq P_{T1} = 8.0 \text{ kW}$$

Il riduttore selezionato risulta idoneo al funzionamento senza che si debba prevedere un circuito ausiliario di raffreddamento.

The gear unit selected is suitable for operation without the need to provide for an auxiliary circuit cooling.

Da der Wert für die gerade definierte zulässige Radiallast F_{r2} , höher ist als die geforderte Radiallast F_{rR2} nach der Formel (20), ist die ausgewählte Welle für den Einsatz unter den geforderten Bedingungen geeignet.

Überprüfung der Wärmeleistung

Nach der Formel (5), kann die abtriebsseitig übertragene Wärmeleistung berechnet werden:

Nach Formel (4), unter Berücksichtigung des dynamischen Wirkungsgrads $\eta_d = 0.94$ des Getriebes EL803, entnommen aus Tabelle (4), kann die antriebsseitig am Getriebe angelegte Leistung berechnet werden:

Aus der Tabelle der Auswahlwerte für das gewählte Getriebe EL803 ergibt sich eine abführbare Wärmeleistung von $P_T = 8.0 \text{ kW}$.

Aus Tabelle (1) S. A13 erhält man unter Berücksichtigung eines Anwendungsfaktors $I = 100 \%$ und einer Umgebungstemperatur von 20°C (entsprechend den Ausgangswerten von S. A33) den Wärmeleistungsfaktor $f_K = 1.0$.

Bei einer Antriebsdrehzahl $n_1 = 1\,500 \text{ rpm}$ und einer waagerechten Einbauposition, ergibt sich aus der Tabelle (2) ein Drehzahlfaktor von $f_V = 1.0$.

Schließlich erhält man aus der Tabelle (3) für die Arbeitsumgebung "groß" einen Umgebungsfaktor $f_R = 1.0$.

Nach Formel (7) ergibt sich eine korrigierte Wärmeleistung von:

Die angelegte Last P_1 liegt unter der korrigierten Wärmeleistung P_{T1} nach Formel (8):

Daraus folgt, dass das gewählte Getriebe für den Betrieb geeignet ist ohne einen zusätzlichen Kühlkreis vorsehen zu müssen.

9. ESEMPIO DI SELEZIONE DEL CIRCUITO DI RAFFREDDAMENTO 9. EXAMPLE OF COOLING CIRCUIT SELECTION 9. BEISPIEL FÜR DIE AUSWAHL DES KÜHLKREISES

Un riduttore **EL1202/FE** con rapporto di riduzione $i = 24.5$ deve funzionare alle seguenti condizioni:

- velocità in ingresso $n_1 = 1'500 \text{ rpm}$;
- potenza applicata in ingresso $P_1 = 20 \text{ kW}$;
- posizione di montaggio orizzontale;
- temperatura ambiente $t_a = 30^\circ\text{C}$;
- fattore d'intermittenza $I = 100\%$
- ambiente di lavoro: **ristretto**

Dalla tabella dei dati di selezione dei riduttori EL1202 si ricava il valore di potenza termica dissipabile $P_t = 17 \text{ kW}$ del riduttore in oggetto.

*A gear unit **EL1202/FE** with reduction ratio $i = 24.5$ must operate in the following conditions:*

- *input speed $n_1 = 1'500 \text{ rpm}$;*
- *applied input power $P_1 = 20 \text{ kW}$;*
- *horizontal mounting position;*
- *ambient temperature $t_a = 30^\circ\text{C}$;*
- *duty cycle $I = 100\%$*
- *work environment: limited*

The dissipatable thermal power $P_t = 17 \text{ kW}$ of the gear unit in question is obtained from the data table for the selection of gear units EL1202.

Ein Getriebe **EL1202/FE** mit einem Übersetzungsverhältnis $i = 24.5$ soll unter folgenden Bedingungen eingesetzt werden:

- Antriebsdrehzahl $n_1 = 1'500 \text{ rpm}$;
- Angelegte Antriebsleistung $P_1 = 20 \text{ kW}$;
- Einbauposition waagerecht;
- Umgebungstemperatur $t_a = 30^\circ\text{C}$;
- Anwendungsfaktor $I = 100\%$
- Arbeitsumfeld: **klein**

Aus der Auswahltafel für die Getriebe EL1202 entnimmt man den Wert für die abföhre Wärmeleistung $P_t = 17 \text{ kW}$ des betreffenden Getriebes.

i	T_2 [Nm]						$n_{1\max}$ [rpm]	$T_{2\max}$ [Nm]	P_t [kW]

Tab. (11)

Dalla tabella (1) di pag. A13, considerando un fattore d'intermittenza $I = 100\%$ ed una temperatura ambiente di 30°C , si ottiene un fattore termico $f_K = 0.85$.

Con velocità in ingresso $n_1 = 1'500 \text{ rpm}$ e posizione di montaggio orizzontale, dalla tabella (2), si ottiene un fattore di velocità $f_V = 1.0$.

Infine, dalla tabella (3), per ambiente di lavoro "ristretto", si ottiene un fattore ambiente $f_R = 0.70$.

Secondo la formula (7), la potenza termica corretta risulterà essere pari a:

Assuming a duty cycle $I = 100\%$ and an ambient temperature of 30°C , a thermal factor $f_K = 0.85$ is obtained from the table (1) p. A13.

With input speed $n_1 = 1'500 \text{ rpm}$ and horizontal mounting position, a speed factor $f_V = 1.0$ is obtained from the table (2).

Lastly, for a "limited" work environment, an environmental factor $f_R = 0.70$ is obtained from the table (3). According to the formula (7), the corrected thermal power is equal to:

Aus Tabelle (1) S. A13 erhält man unter Berücksichtigung eines Anwendungsfaktors $I = 100\%$ und einer Umgebungs-temperatur von 30°C den Wärmefaktor $f_K = 0.85$.

Bei einer Antriebsdrehzahl $n_1 = 1'500 \text{ rpm}$ und einer waagerechten Einbauposition, ergibt sich aus der Tabelle (2) ein Drehzahlfaktor von $f_V = 1.0$.

Schließlich erhält man aus der Tabelle (3) für die Arbeitsumgebung "klein" einen Umgebungs faktor $f_R = 0.70$.

Nach Formel (7) ergibt sich eine korrigierte Wärmeleistung von:

$$P_{T1} = 17 \times 0.85 \times 1.0 \times 0.70 = 10 \text{ kW}$$

La potenza applicata P_1 risulta non essere inferiore alla potenza termica corretta P_{T1} , secondo la formula (8):

The applied power P_1 is not lower than the corrected thermal power P_{T1} , according to the formula (8):

Die angelegte Last P_1 liegt nicht unter der korrigierten Wärmeleistung P_{T1} nach Formel (8):

$$P_1 = 20 \text{ kW} \quad \leq \quad P_{T1} = 10 \text{ kW} \quad \longrightarrow$$

Condizione non verificata!
Condition not verified!
Bedingung wird nicht überprüft!

Pertanto, per il riduttore in oggetto, è necessario prevedere un circuito ausiliario di raffreddamento.

Si calcola quindi la potenza termica da dissipare, secondo la formula (9). Per fare questo è necessario ricavare, dalla tabella (4), per il riduttore EL1202, il rendimento dinamico $\eta_d = 0.96$.

Si ha quindi che la potenza termica da dissipare è

Therefore, for the gear unit in question, it is necessary to provide for an auxiliary circuit cooling.

Then calculate the thermal power to be dissipated, according to the formula (9). To do this, the dynamic efficiency $\eta_d = 0.96$ must be obtained from the table (4), for the gear unit EL1202.

The thermal power to be dissipated is

Daher ist für das betreffende Getriebe ein zusätzlicher Kühlkreis notwendig.

Man berechnet also die abzuführende Wärmeleistung nach der Formel (9). Dazu muss man aus der Tabelle (4) für das Getriebe EL1202, den dynamischen Wirkungsgrad $\eta_d = 0.96$ entnehmen.

Daraus ergibt sich die abzuführende Wärmeleistung von

$$P_C = (20 - 10) \times (1 - 0.96) = 0.4 \text{ kW}$$

Definita la potenza termica da dissipare P_C , contattare il referente DANA di zona per la selezione del circuito di raffreddamento più adeguato fra quelli a disposizione.

After establishing the thermal power to be dissipated P_C , consult the DANA area contact person to select the most suitable cooling circuit from those available.

Nach der Bestimmung der abzuführenden Wärmeleistung P_C , Biten wir Sie, für die Auswahl des geeigneten Kühlkreislaufs aus dem Angebot sich an die DANA Kontaktperson der zone zu wenden.

10. ESEMPIO DI SELEZIONE DEL FRENO LAMELLARE 10. EXAMPLE OF MULTI-DISC BRAKE SELECTION 10. BEISPIEL FÜR DIE AUSWAHL DER LAMELLENBREMSE

Un riduttore **EL503/FE** con rapporto di riduzione $i = 85.6$ deve funzionare alle seguenti condizioni:

- coppia in uscita richiesta $T_{2R} = 4'500 \text{ Nm}$
- fattore di sicurezza sul freno $S_f = 1.2$

Dalla relazione (1) di pag. A11, si calcola la coppia frenante richiesta:

A gear unit **EL503/FE** with reduction ratio $i = 85.6$ must work in the following conditions:

- required output torque $T_{2R} = 4'500 \text{ Nm}$
- brake safety factor $S_f = 1.2$

By the equation (1) p. A11, calculate the required braking torque:

$$T_{BR} = \frac{1.2 \times 4'500}{85.6} = 63.1 \text{ Nm}$$

Dalle tabelle dimensionali del riduttore EL503/FE, si ricava che la tipologia di freno lamellare prevista è la "MB3".

From the dimensional tables of the gear unit EL503/FE, the type of multi-disc disk brake provided for is "MB3".

Ein Getriebe **EL503/FE** mit einem Übersetzungsverhältnis $i = 85.6$ soll unter folgenden Bedingungen eingesetzt werden:

- gefordertes Antriebsdrehmoment $T_{2R} = 4'500 \text{ Nm}$
- Bremsen-Sicherheitsfaktor $S_f = 1.2$

Mit der Formel (1) von Seite A11 wird das geforderte Bremsmoments berechnen:

Aus der Tabelle mit den Maßen des Getriebes EL503/FE, entnimmt man, dass der vorgesehene Lamellen Bremstyp „MB3“ heißt.

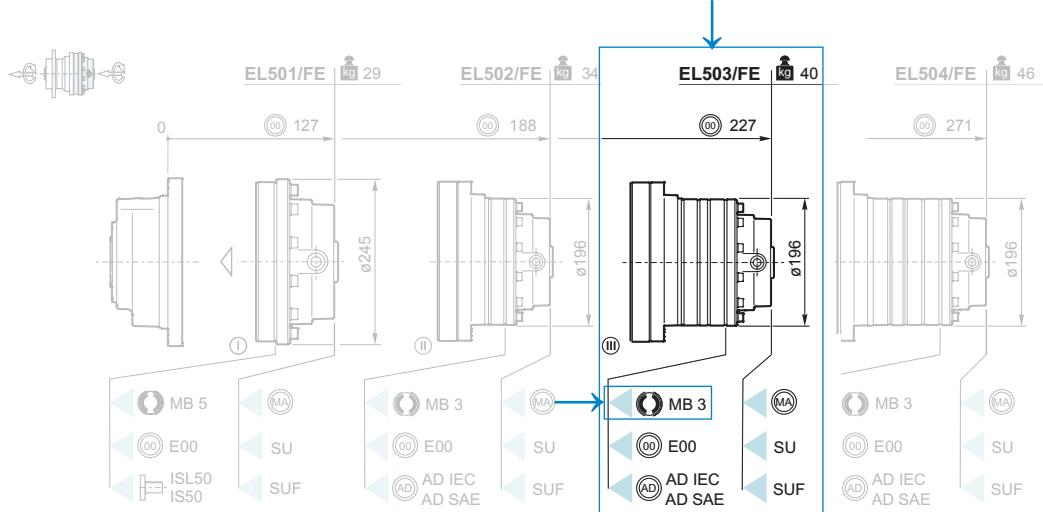

Fig. (3)

Al capitolo "Freni lamellari a bagno d'olio", nella tabella corrispondente alla tipologia MB3, si seleziona il freno che presenta una coppia frenante T_B immediatamente superiore alla coppia T_{BR} appena calcolata.

In the section "Oil-bath multi-disc disk brakes", in the table corresponding to type MB3, select the brake which has a braking torque T_B immediately higher than the torque T_{BR} just calculated.

Unter dem Kapitel „Ölbad-Lamellenbremsen“ wählt man in der entsprechenden Tabelle für den Typ MB3 die Bremse aus, die ein Bremsmoment aufweist von T_B , das etwas über dem soeben berechneten Bremsmoment T_{BR} liegt.

	T_B [Nm]	p [bar]	p_{MAX} [bar]	V_d [cm ³] lamelle nuove new discs Neue Lamellen
	MB306.2C			15
MB309.2C	50	20.3	300	15
MB312.2C	66	27.1	300	15
MB309.4C	99	20.3	300	15
MB312.4C	132	27.1	300	15
MB310.6C	165	22.5	300	15
MB312.6C	198	27.1	300	15
MB315.6C	248	33.8	300	15
MB310.10C	275	22.5	300	15
MB315.8C	330	33.8	300	15

Tab. (12)

Si identifica quindi il freno tipo **MB312.2C**, con coppia frenante statica $T_B = 66 \text{ Nm}$.

Then identify the brake type **MB312.2C**, with static braking torque $T_B = 66 \text{ Nm}$.

Man findet dann die Bremse Typ **MB312.2C**, mit einem statischen Bremsmoment von $T_B = 66 \text{ Nm}$.

Dalla formula (23) di pag. A28, è possibile calcolare la coppia frenante in uscita al riduttore:

From the formula (23) p. A28, it is possible to calculate the gear unit output braking torque:

Anhand der Formel (23) auf Seite A28 kann man das abtriebsseitige Bremsmoment für das Getriebe berechnen:

$$T_{2B} = 66 \times 85.6 = 5'650 \text{ Nm}$$

Dalla tabella di selezione dei riduttori EL503, si ricava la coppia massima trasmissibile T_{2MAX} per il rapporto $i = 85.6$, che risulta $T_{2MAX} = 6\,500 \text{ Nm}$

The maximum transmissible torque T_{2MAX} for the ratio $i = 85.6$, which is $T_{2MAX} = 6\,500 \text{ Nm}$, is obtained from the table for selecting gear units EL503

Aus der Auswahltafel für die Getriebe EL503 entnimmt man das max. übertragbare Drehmoment T_{2MAX} für das Übersetzungsverhältnis $i = 85.6$, also $T_{2MAX} = 6\,500 \text{ Nm}$

i	T_2 [Nm]						n_{1MAX} [rpm]	T_{2MAX} [Nm]	P_t [kW]
	$n_2 \times h$ 10'000	$n_2 \times h$ 25'000	$n_2 \times h$ 50'000	$n_2 \times h$ 100'000	$n_2 \times h$ 500'000	$n_2 \times h$ 1'000'000

Tab. (13)

La coppia frenante in uscita al riduttore T_{2B} risulta inferiore alla coppia massima trasmissibile dal riduttore, secondo la relazione (24) di pag. A28:

The gear unit output braking torque T_{2B} is lower than the maximum torque transmitted by the gear unit, according to the equation (24) p. A28:

Das abtriebsseitige Bremsmoment des Getriebes T_{2B} liegt unter dem max. übertragbaren Drehmoment des Getriebes nach der Formel (24) S. A28:

$$T_{2B} = 5\,650 \text{ Nm} \leq T_{2MAX} = 6\,500 \text{ Nm}$$

Il freno selezionato risulta quindi essere adeguato al riduttore in oggetto.

The brake selected is therefore suitable for the gear unit in question.

Die ausgewählte Bremsen ist also für das betreffende Getriebe geeignet.

ACCESSORI

ACCESSORIES

ZUBEHÖR

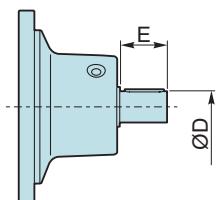

Pignoni sono disponibili a richiesta.
Salvo diversa esigenza, sono induriti superficialmente (tempra ad induzione o cementazione)
*Pinions are available on request.
Unless otherwise required, they are surface hardened (induction hardening or casehardening)*
Ritzel auf Wunsch verfügbar.
Außer bei anderen Anforderungen oberflächengehärtet (Induktionshärten oder Einsatzhärten)

Pignone
Pinion
Ritzel

Pignoni sono disponibili a richiesta.

Salvo diversa esigenza, sono induriti superficialmente (tempra ad induzione o cementazione)

Pinions are available on request.

Unless otherwise required, they are surface hardened (induction hardening or casehardening)

Ritzel auf Wunsch verfügbar.

Außer bei anderen Anforderungen oberflächengehärtet (Induktionshärten oder Einsatzhärten)

Pignone
Pinion
Ritzel

Pignoni sono disponibili a richiesta.

Salvo diversa esigenza, sono induriti superficialmente (tempra ad induzione o cementazione)
Pinions are available on request.

Unless otherwise required, they are surface hardened (induction hardening or casehardening)

Ritzel auf Wunsch verfügbar.

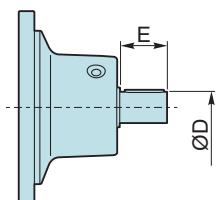

Außer bei anderen Anforderungen oberflächengehärtet (Induktionshärten oder Einsatzhärten)

Pignone
Pinion
Ritzel

Pignoni sono disponibili a richiesta.

Salvo diversa esigenza, sono induriti superficialmente (tempra ad induzione o cementazione)
Pinions are available on request.

Unless otherwise required, they are surface hardened (induction hardening or casehardening)
Ritzel auf Wunsch verfügbar.
Außer bei anderen Anforderungen oberflächengehärtet (Induktionshärtung oder Einsatzhärtung)

I valori dei carichi radiali dei supporti uscita MP-MP1 e ML-ML1 sono validi soltanto se sono utilizzati entrambi i centraggi supporto sulla struttura del cliente. In caso di non utilizzo del secondo centraggio contattare il referente DANA di zona.

The values of radial loads of output supports MP-MP1 and ML-ML1 are valid only if they are used both spigots on the support structure of the customer; in case of non-use of the second spigot consult the DANA area contact person.

Die Werte der Radiallasten der Ausgangslagerung MP-MP1 und ML-ML1 sind nur gültig, wenn beide Zentrierungen an der Tragstruktur des Kunden verwendet werden; falls die zweite Zentrierung nicht verwendet wird, wenden Sie sich an die DANA Kontaktperson der zone zu wenden.

13. SUPPORTI MASCHIO IN INGRESSO

I supporti in ingresso descritti di seguito sono utilizzati quando il motore di azionamento, generalmente elettrico, è collegato all'albero di ingresso mediante giunto elastico, o puleggia e cinghie.

La normale posizione di montaggio è con l'asse orizzontale e la lubrificazione è comune al riduttore. Per altre posizioni di montaggio, occorre adeguare la lubrificazione. Si prega di contattare il referente DANA di zona per maggiori dettagli.

La velocità massima di lavoro è generalmente 1'800 rpm.

Supporti maschio tipo ISL/IS

I supporti di tipo ISL sono specifici per utilizzo con giunto elastico o, in generale, quando la componente di carico radiale è molto ridotta: in tutti gli altri casi è consigliato l'utilizzo di supporti di tipo IS.

Consultare le tabelle di selezione per quanto riguarda le dimensioni dei supporti e i carichi ammissibili.

13. INPUT MALE SHAFT

The input supports described below are used when the driving motor, which is usually electric, is connected to the input shaft by a flexible coupling or belts and pulleys.

The normal mounting position is with the horizontal axis and lubrication is common with the gear unit. For other mounting positions, the lubrication must be adapted. Please consult the DANA area contact person for more details.

Max. working speed is generally 1'800 rpm.

ISL/IS type male supports

ISL type supports are specific for use with flexible coupling or, in general, when the radial load component is very small: in all other cases it is advisable to use IS type.

Consult the selection tables with regard to the sizes of the supports and the permissible loads.

13. ANTRIEBSWELLENSTÜMPFE

Die im Folgenden beschriebenen Antriebswellen werden eingesetzt, wenn der normalerweise elektrische Antriebsmotor mittels einer elastischen Kupplung oder mithilfe von Riemscheiben und Riemen angeschlossen wird.

Die normale Einbaulage ist koaxial und die Schmierung erfolgt gemeinsam mit dem Getriebe. Bei anderen Einbaulagen ist die Schmierung entsprechend anzupassen. Wenden Sie sich für weitere Einzelheiten an sich an die DANA Kontakterson der zone zu wenden.

Die max. Betriebsdrehzahl beträgt im allgemeinen 1'800 rpm.

Wellenstümpfe Typ ISL/IS

Die Wellen vom Typ ISL sind spezifisch für den Einsatz mit elastischen Kupplungen vorgesehen bzw. im Allgemeinen bei sehr geringer Radiallast-Komponente: in allen anderen Fällen wird zur Verwendung der Welle Typ IS geraten.

Für die Wellen Abmaße und die zulässigen Lasten siehe Auswahltafel.

Tab. (22)

14. FRENI LAMELLARI A BAGNO D'OLIO

I riduttori possono essere equipaggiati in entrata con freno a dischi multipli in bagno d'olio ad apertura idraulica. Questi freni contengono un pistone che agisce, sotto la spinta di una serie di molle, su coppie di dischi alternati fissi e mobili: lo sbloccaggio del pistone avviene per effetto della pressione idraulica di comando.

Questi freni hanno quindi un funzionamento negativo, in quanto si inseriscono automaticamente in assenza di pressione di comando, mentre si aprono al raggiungimento della pressione minima di apertura: sono da impiegare esclusivamente come freni di stazionamento e non per la frenatura dinamica.

Le prestazioni riportate nelle tabelle seguenti sono calcolate con un margine di accuratezza di +/- 10% e in assenza di contropressione; nel caso in cui sia presente una contropressione, la coppia frenante viene percentualmente ridotta nel rapporto contropressione/pressione di apertura.

Si ricorda che le alte velocità di rotazione, oppure prolungati periodi di funzionamento con asse verticale, possono generare elevati aumenti di temperatura: in questi casi, contattare il referente DANA di zona.

La lubrificazione dei freni è comune a quella dei riduttori. Per il comando freno, si consigliano oli minerali o sintetici resistenti al calore e all'invecchiamento, con viscosità ISO VG 32 e indice di viscosità pari o superiore a 95: gli oli idraulici sono generalmente idonei.

Nel capitolo "Lubrificazione" sono riportati alcuni tipi di olio consigliati.

14. MULTIDISC BRAKE IN OIL

The gear unit inputs can be equipped with hydraulically released oil-bath multidisc brakes.

These brakes have a piston which acts, under the thrust of a series of springs, on pairs of alternating fixed and mobile discs: piston release occurs through the control hydraulic pressure.

These brakes therefore have negative operation, as they are applied automatically in the absence of control pressure, whereas they open when the minimum release pressure is reached: they are only used as parking brakes and not for dynamic braking.

The performance values given in the following tables are calculated with a margin of accuracy of +/- 10% and in the absence of back pressure; if there is a back pressure, the braking torque is reduced in percentage according to back pressure/release pressure.

High rotation speeds, or prolonged operation with vertical axis, can generate considerable temperature increases; in such cases, consult the DANA area contact person.

Lubrication of the brakes is common with that of the gear units. For the brake control, it is advisable to use mineral or synthetic oils resistant to heat and aging, with ISO VG 32 viscosity and viscosity index greater than or equal to 95: hydraulic oils are generally suitable.

The section "Lubrication" gives some recommended types of oils.

14. LAMELLENBREMSEN IM ÖLBAD

Die Getriebe können antriebsseitig mit im Ölbad-Lamellenbremsen mit hydraulischer Entlüftung ausgestattet werden. Die Bremsen sind mit einem Kolben ausgerüstet, der unter dem Druck einer Reihe von Federn abwechselnd auf fixe und bewegliche Scheibenpaare wirkt; das Lösen der Bremse wird hydraulisch gesteuert.

Diese Bremsen haben demzufolge eine „negative“ Funktion, da sie automatisch wirken, wenn kein Steuerdruck anliegt und werden bei Erreichen eines Mindestdrucks entlüftet: sie können ausschließlich als Feststellbremse eingesetzt werden und nicht für den dynamischen Bremsvorgang.

Die in den folgenden Tabellen aufgeführten Leistungen wurden mit einer Genauigkeitsspanne von +/- 10 % ohne anstehenden Gegendruck berechnet; bei anstehendem Gegendruck verringert sich das Bremsmoment proportional im Verhältnis von Gegeben druck/Öffnungsdruck.

Es wird daran erinnert, dass hohe Drehzahlen und lange Betriebszeiten mit vertikaler Achse zu starken Temperaturerhöhungen führen können: in diesen Fällen nehmen Sie bitte sich an die DANA Kontaktperson der zone zu wenden.

Die Schmierung der Bremsen erfolgt wie bei den Getrieben. Für die Steuerung der Bremse sollten wärme- und alterungsbeständige Mineralöle mit Viskosität ISO VG 32 verwendet werden mit einem Viskositätsindex gleich oder höher als 95: Hydrauliköle sind im allgemeinen dafür geeignet.

Im Abschnitt „Schmierung“ werden einige Ölsorten aufgeführt.

15. ENTRATE UNIVERSALI

L'entrata universale è una configurazione che, montata in ingresso ai riduttori, permette di accoppiare le più diverse tipologie di motorizzazioni tramite una flangia e un manicotto di adattamento appositi.

Esistono due diverse dimensioni di entrata universale, in funzione delle grandezze montate come stadio in ingresso sui riduttori.

L'applicabilità può essere dedotta dalle tavole dimensionali delle varie grandezze.

15. UNIVERSAL INPUTS

The universal joint is a configuration mounted on the gear unit input, enabling the coupling of various types of motorizations by means of a special flange and adapter coupling.

Two different universal joint sizes are available according to the sizes mounted as input stage on the gear units.

Applicability can be obtained from the dimensional tables of the various sizes.

15. UNIVERSAL-ANTRIEBE

Der Universalantrieb ist eine Anordnung, die am Getriebeeingang montiert wird und die ermöglicht, die unterschiedlichsten Motortypen mithilfe eines Flansches oder einer Adapterhülse anzukoppeln.

Je nach der auf den Getrieben montierten Antriebsstufen stehen drei verschiedene Größen des Universalantriebs zur Verfügung.

Die Eignung kann den Maßbildern der einzelnen Baugrößen entnommen werden.

18. STATO DI FORNITURA

Salvo diverse disposizioni contrattuali, i riduttori sono verniciati esternamente con fondo anticorrosivo bicomponente, a base di resine epossidiche idrosolubili, blu RAL 5012. La protezione è idonea a resistere a normali ambienti industriali anche esterni e consente ulteriori finiture con smalti sintetici, nitro-sintetici o bicomponente. Nel caso si prevedano condizioni ambientali particolarmente aggressive, è necessario utilizzare cicli di verniciatura speciali, eseguibili a richiesta.

Le parti esterne lavorate del riduttore, come le estremità degli alberi, i piani di appoggio i centralli ecc., vengono protette con olio antiossidante (Tectyl). Le pareti interne delle carcasse del riduttore sono vernicate con vernice antolio e i cinematismi sono protetti con olio antiossidante.

Tutti i riduttori, salvo diverse disposizioni contrattuali, vengono forniti senza lubrificante, come indicato da un'apposita etichetta adesiva applicata al riduttore stesso per evidenziarne lo stato.

Alcuni supporti di uscita prevedono la lubrificazione a grasso del cuscinetto lato uscita: in tal caso, i supporti sono già lubrificati e pronti ad entrare in servizio al momento della fornitura. Nel caso di supporti con lubrificazione a grasso del cuscinetto lato uscita, non è necessario prevedere l'ingrassaggio periodico, in quanto la loro lubrificazione è da intendersi "a vita".

I riduttori vengono imballati e spediti in casse o su pallets idonei a resistere in normali ambienti industriali.

Ogni riduttore viene fornito corredata di "Manuale di Installazione e Manutenzione", "Dichiarazione del Fabbriante" e "Attestato di Conformità" 2.1 secondo UNI EN10204.

18. SUPPLY CONDITION

Unless otherwise specified in the contract, the gear units are painted externally with anticorrosive 2-component water-soluble epoxy resin based primer, blue RAL 5012. The protection is suitable for withstanding normal industrial environments (also external) and can be finished with synthetic, nitro-synthetic or 2-component paints. In case of particularly aggressive environmental conditions, it is necessary to use special painting cycles, carried out on request.

The machined external parts of the gear unit, such as the shaft ends, support surfaces, spigots, etc., must be protected with antioxidant oil (Tectyl). The inside walls of the gear unit casings are painted with oil-proof paint and the kinematic mechanisms are protected with antioxidant oil.

Unless otherwise specified in the contract, all the gear units are supplied without lubricant: as specified by a special sticker placed on the gear unit to indicate its condition.

Some output supports provide for grease lubrication of the output side bearing: in this case, the supports are already lubricated and ready to enter service at the time of delivery. In case of supports with grease-lubricated output side bearing, periodical greasing is not required, as lubrication is long-life.

The gear units are packed and shipped in crates or on pallets suitable to withstand normal industrial environments.

Each gear unit comes with an "Installation and Maintenance Manual", "Manufacturer's Declaration" and "Certificate of Conformity" 2.1 according to UNI EN10204.

18. LIEFERBENDING-UNGEN

Außer, wenn vertraglich anders festgelegt, werden die Getriebe außen mit einer zweikomponenten Rostschutzgrundierung auf wasserlöslicher Epoxidharzbasis versehen, blau RAL 5012. Der Schutz ist für normale Industrieumgebungen und Außenbereiche geeignet und gestattet zusätzliche Überlackierung mit Synthetiklacken, nitrosynthetischen Lacken oder 2K-Lacken. Beim Einsatz in besonders aggressiven Umgebungen müssen mehrere Schichten mit Speziallack aufgetragen werden. Das ist auf Wunsch ausführbar.

Die bearbeiteten Außenteile des Getriebes wie die Stümpfe der Wellen, die Stützflächen, Zentrieransätze usw. werden mit einem Film oxidationshemmenden Öls (Tectyl) geschützt. Die Innenanteile der Getriebegehäuse werden mit schmierölfesten Lacken lackiert und die Getriebe sind durch oxidationshemmendes Öl geschützt.

Alle Getriebe, soweit vertraglich nicht anders vereinbart, werden ohne Schmiermittel geliefert. Ein Aufkleber auf dem Getriebe weist auf diesen Umstand hin. Einige Abtriebskonfigurationen sehen die Schmierung der abtriebsseitigen Lager mit Fett vor: in diesen Fällen sind die Wellen bereits geschmiert und zum Lieferzeitpunkt einsatzbereit. Im Fall von Abtriebskonfigurationen mit abtriebsseitigen geschmierten Lager ist eine periodische Schmierung nicht notwendig, da es sich um eine Lebensdauerschmierung handelt.

Alle Getriebe werden verpackt und in geeigneten Kisten oder auf Paletten für normale Industrieumgebungen versandt. Alle Getriebe DANA sind mit einem spezifischen „Installations- und Wartungshandbuch“, mit „Herstellererklärung“ und „Konformitätsbescheinigung“ – 2.1 nach UNI EM10204 versehen.

19. CONDIZIONI DI STOCCAGGIO

Nel caso occorra immagazzinare il prodotto per un periodo superiore a 2 mesi, attenersi a quanto segue:

- proteggere alberi e centralli con una pellicola di grasso o con prodotti protettivi anticorrosione
- riempire completamente il riduttore con il lubrificante previsto per l'applicazione
- immagazzinare in luogo asciutto e con temperatura compresa fra i -5 °C e +30 °C
- proteggere il riduttore da sporcizia, polvere e umidità
- interporre sempre, fra il riduttore e il suolo, un supporto in legno o di altra natura, in modo da evitare il contatto diretto con il suolo

Per immagazzinamento prolungato oltre 1 anno, decade l'efficienza delle tenute rotanti. In tal caso, si consiglia un controllo periodico facendo ruotare gli ingranaggi tramite l'azionamento manuale dell'albero in entrata.

19. STORING CONDITION

If the product is to be stored for more than 2 months:

- protect shafts and spigots with a film of grease or anti-corrosion protective products
- completely fill the gear unit with the lubricant provided for the application
- store in a dry place with temperature of between -5°C and +30°C
- protect the gear unit from dirt, dust and damp
- always place a support in wood or other material between the gear unit and the ground to prevent direct contact with the ground

When storing for more than 1 year, the rotating seals will lose efficiency. In this case, it is advisable to do a periodical check, rotating the gears by manually operating the input shaft.

19. LANGERBENDING-UNGEN

Gehen Sie bei einer Lagerung des Produktes für einen Zeitraum von mehr als 2 Monaten wie folgt vor:

- Wellen und Zentrieransätze mit einem Fettfilm oder mit einem Frostschutzmittel schützen
- Getriebe vollständig mit dem für die Anwendung vorgesehenen Schmiermittel füllen
- Lagern Sie die Getriebe an einem trockenen Ort mit einer Temperatur zwischen -5 °C und +30 °C
- Getriebe vor Schmutz, Staub und Feuchtigkeit schützen
- Getriebe auf einer Unterlage aus Holz oder aus sonstigem Material lagern, sodass direkter Kontakt mit dem Boden vermieden wird

Bei Lagerung von mehr als 1 Jahr verlieren die Wellendichtungen ihre Wirksamkeit. In diesem Fall wird zu einer periodischen Überprüfung geraten, bei der das Getriebe antriebsseitig von Hand gedreht wird.

In presenza di freno lamellare negativo, è necessario sbloccare il freno con pompa idraulica o similare (per pressione di apertura freno vedere capitolo "Freni lamellari a bagno d'olio"). All'atto dell'avviamento è consigliata la sostituzione delle garnizioni.

In case of negative multi-disc brake, it is necessary to release the brake with hydraulic pump or similar (for brake opening pressure, see the section "Oil bath multi-disc brakes"). On starting, it is advisable to replace the seals.

Ist eine Lamellenbremse eingebaut, muss diese mithilfe einer Hydraulikpumpe oder ähnlichem entlüftet werden (für den Entlüftungsdruck siehe Kapitel „Ölbad-Lamellenbremsen“). Bei der Inbetriebnahme sollten die Dichtungen ersetzt werden.

20. INSTALLAZIONE

Generale

L'installazione dei riduttori deve essere effettuata con cura e professionalità, impiegando personale adeguatamente istruito e tecnicamente preparato.

La predisposizione al funzionamento deve avvenire rispettando tutte le indicazioni tecniche contenute nel Disegno Dimensionale di riferimento.

Tutte le operazioni di installazione debbono essere ispirate ai massimi livelli di sicurezza:

1. nei confronti dell'incolumità degli operatori e di terzi
2. nei confronti del corretto funzionamento del riduttore
3. nei confronti della sicurezza di esercizio

A questo proposito ricordiamo che:

- è assolutamente vietata ogni manipolazione arbitraria al riduttore e a tutti gli accessori eventualmente predisposti all'origine
- tutte le operazioni di sollevamento e trasporto debbono essere effettuate evitando gli urti alle estremità d'albero ed utilizzando apposite cinghie di sospensione o i golfari opportunamente predisposti e verificando che i mezzi di sollevamento siano dotati di sufficiente portata
- è assolutamente vietato eseguire lavori di saldatura sui riduttori
- qualsiasi lavoro di installazione o manutenzione deve essere eseguito con il riduttore fermo. Quindi è buona norma assicurarsi che non possano verificarsi inserimenti non intenzionali della forza motrice
- per quanto riguarda l'entrata del riduttore, i motori elettrici od idraulici sono frequentemente applicati con il sistema di flangiatura Universale E00 DANA (vedere il capitolo "Entrate Universali"). Si ricorda che la flangiatura E00 viene normalmente impiegata per motori di massa fino a 100 kg circa e coppia di 1'000 Nm massimo. Nel caso di motori più pesanti si può ricorrere a flangiature specifiche: a tal fine si prega di contattare il referente DANA di zona.
- nel caso di collegamenti che implicano l'impiego di parti rotanti come alberi, giunti o pulegge con cinghie, è obbligatorio prevedere adeguate protezioni antinfortunistiche

20. INSTALLATION

General

The gear units must be carefully installed by suitably trained technical personnel.

Preparation for operation must occur in compliance with all the technical specifications given on the reference Dimensional Drawing.

All installation operations must ensure:

1. *safety of operators and third parties*
2. *correct operation of the gear unit*
3. *safe operation*

In this respect:

- *any arbitrary tampering with the gear unit and with any accessories originally arranged is strictly prohibited*
- *all lifting and carrying operations must be carried out avoiding impacts on the shaft ends, using special lifting straps or the specially arranged eye-bolts, making sure that the lifting equipment is of adequate capacity*
- *welding work on the gear units is absolutely prohibited*
- *any installation or maintenance work must be carried out with the gear unit stopped. Therefore it is advisable to ensure the prevention of unintentional activation of the driving force*
- *regarding the gear unit input, the electric or hydraulic motors are often mounted with the DANA E00 Universal adapter system (see the section "Universal Joint"). It should be noted that the adapter E00 is normally used for motors weighing up to approx. 100 kg and 1'000 Nm max. torque. With heavier motors, specific adapters can be used: please consult the DANA area contact person.*
- *with connections involving the use of revolving parts such as shafts, couplings or pulleys with belts, adequate accident-prevention devices must be provided*

20. INSTALLATION

Allgemeine Hinweise

Die Installation der Getriebe muss sorgfältig und professionell durch technisch ausgebildete Fachkräfte ausgeführt werden.

Die Vorbereitung zur Inbetriebnahme muss entsprechend den technischen Angaben der betreffenden Maßbilder erfolgen.

Bei allen Installationsarbeiten sind immer die erforderlichen Sicherheitsmaßnahmen zu ergreifen:

1. Sicherheit für Techniker und Dritte
2. ordentlicher Betrieb des Getriebes
3. Betriebssicherheit

Diesbezüglich wird daran erinnert, dass:

- jede willkürliche Veränderung der Getriebe und des eventuell werkseitig vorgerüsteten Zubehörs ist strengstens untersagt
- Beim Anheben und Transport sind Stöße gegen die Wellenstümpfe zu vermeiden und Transportgurte oder die eigens vorgerüsteten ÖSENSchrauben zu verwenden. Kontrollieren Sie immer, dass das Hebezeug eine ausreichende Tragfähigkeit aufweist
- Es ist strengsten verboten, an den Getrieben Schweißarbeiten auszuführen
- Sämtliche Installations- oder Instandhaltungsarbeiten sind bei stehendem Getriebe durchzuführen. Es hat sich daher bewährt, sich zuvor immer zu vergewissern, dass der Antrieb nicht unvorhergesehen anlaufen kann
- Antriebsseitig werden die Elektro- oder Hydraulikmotoren oft mit dem DANA - der Universalsystem für Flanschverbindungen E00 angebaut (siehe Kapitel "Universalantriebe"). Es wird daran erinnert, dass die Flanschverbindung E00 gewöhnlich für Motoren bis zu einem Gewicht von ca. 100 kg und mit maximalem Drehmoment von 1'000 Nm eingesetzt wird. Bei schwereren Motoren stehen spezielle Flanschverbindungen zur Verfügung: wenden Sie sich an die DANA Kontakterson der zone zu wenden.
- Bei Verbindung mithilfe von rotierenden Teilen wie Wellen, Kupplungen und Riemscheiben ist die Installation von Unfallschutzverkleidungen gesetzlich vorgeschrieben

Montaggio dell'albero

Prima del montaggio, pulire accuratamente le superfici di accoppiamento e lubrificarle con adeguati prodotti anti-seizure (ad eccezione delle versioni con albero cavo tipo FS, per le quali si rimanda al capitolo "Giunto ad attrito").

E' necessario che le operazioni di installazione e rimozione vengano eseguire con attrezzature adeguate, come estrattori e viti di estrazione, utilizzando i fori filettati previsti sugli alberi: in ogni caso, evitare impatti o urti che potrebbero danneggiare in modo irreparabile i componenti interni del riduttore.

Per le dimensioni dell'albero condotto, fare riferimento al capitolo "Uscite".

Shaft assembly

Before assembly, carefully clean the mating surfaces and lubricate them with suitable anti-seizure products (except for versions with hollow shaft type FS - see the section "Shrink disc").

Installation and removal operations must be done with suitable equipment, such as extractors and extraction screws, using the threaded holes provided on the shafts: in any case, avoid any impacts or knocking that could cause permanent damage to the internal parts of the gear unit.

For the sizes of the driven shaft, refer to the section "Outputs".

Einbau der Welle

Vor dem Einbau Kontaktflächen sorgfältig reinigen und mit geeignetem Verschleißhemmer schmieren (ausgenommen Ausführungen mit Hohlwelle Typ TS. Hierfür verweisen wir auf das Kapitel "Reibungskupplung").

Ein- und Ausbaurbeiten müssen mit geeignetem Werkzeug ausgeführt werden, wie Abzieher und Abziehschrauben. Dabei sind die Gewindebohrungen in den Wellen zu benutzen: auf alle Fälle sind Schläge und Stöße zu vermeiden, die zu irreparablen Schäden an den Innenteilen des Getriebes führen können.

Für die Abmaße der Abtriebswelle siehe Kapitel "Abtriebswellen".

Montaggio dei supporti a flangia e con piede

Le superfici di accoppiamento devono essere lavorate con un grado di finitura adeguato a garantire il coefficiente di attrito richiesto (indicativamente Ra 3.2 µm). Per garantire l'allineamento fra il riduttore, il motore e la macchina azionata, attenersi alle tolleranze indicate negli schemi riportati sotto.

Flange and foot mounting of supports

The mating surfaces must be machined with a degree of finish that ensures the required coefficient of friction (indicatively Ra 3.2 µm). To ensure alignment between the gear unit, motor and the driven machine, respect the tolerances given in the diagrams below.

Einbau der Flansch montierten und Fußleisten montierten Konfigurationen

Die Kontaktflächen sind mit einem Feinheitsgrad zu bearbeiten, dass der geforderte Abriebkoeffizient (Richtwert Ra 3.2 µm) sichergestellt ist. Zur Sicherstellung der Ausrichtung von Getriebe, Motor und angetriebener Maschine sind die in den nachstehenden Zeichnungen angegebenen Toleranzen einzuhalten.

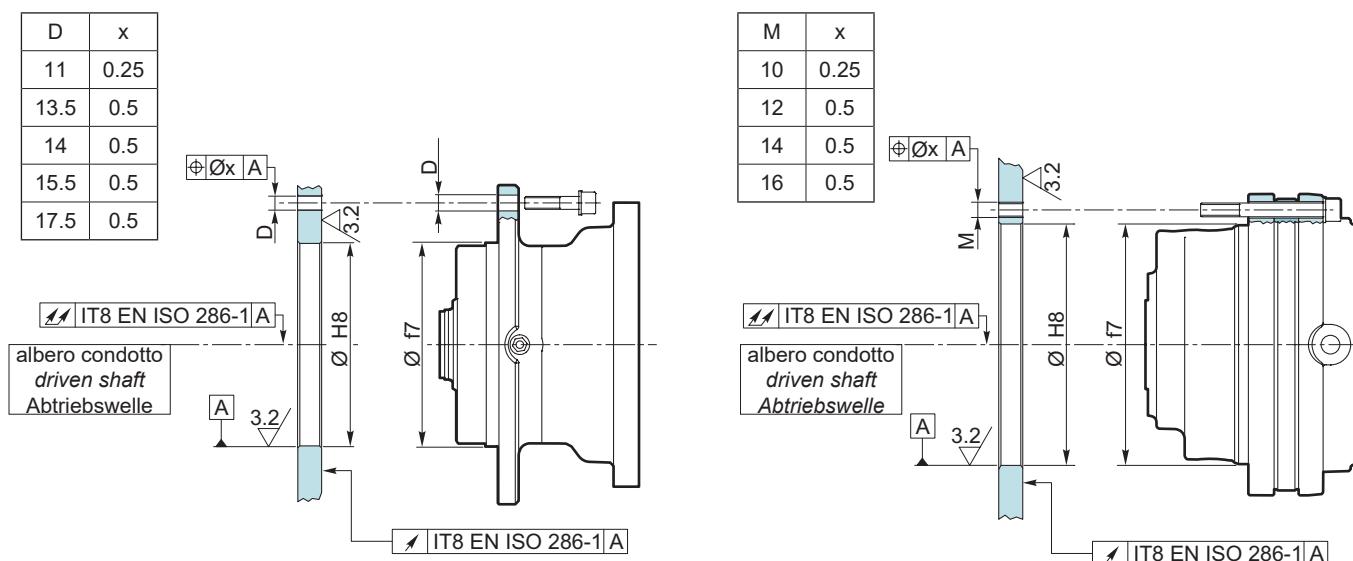

Fig. (17)

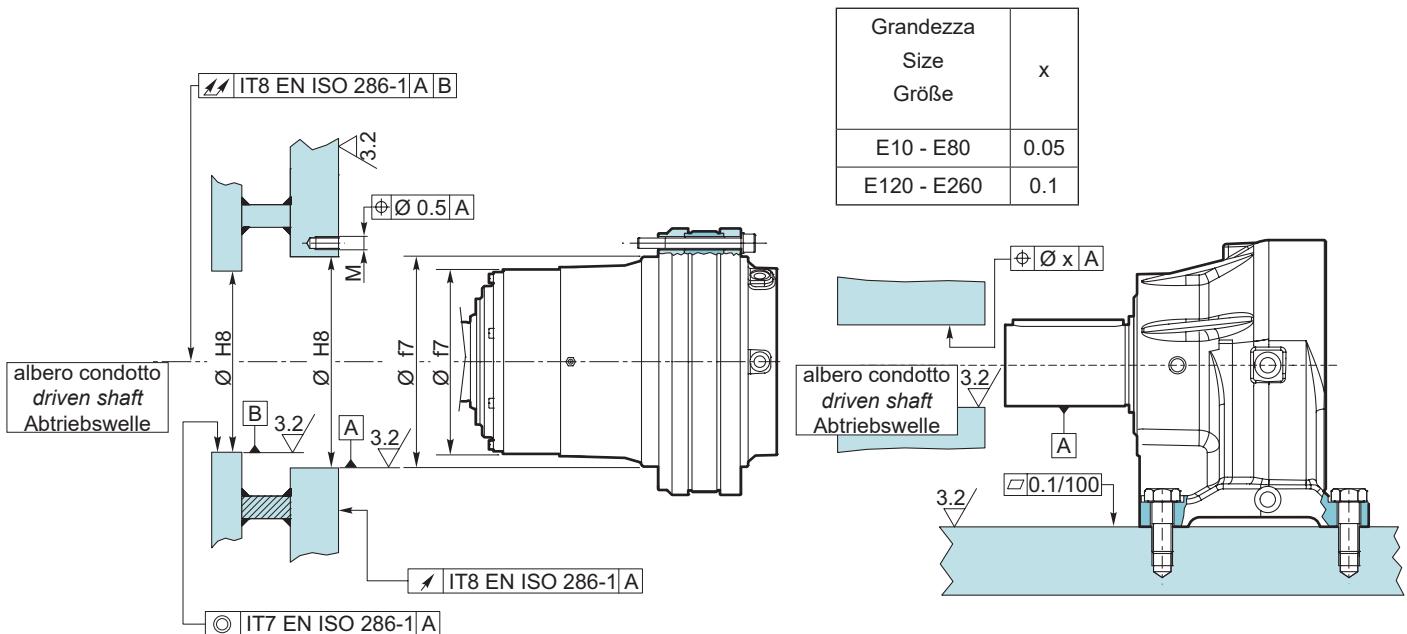

Fig. (18)

Prima dell'installazione pulire e sgrassare adeguatamente le superfici di accoppiamento, eliminando eventuali tracce di vernice. Nel caso in cui la coppia massima da trasmettere sia maggiore di $0.7 \times T_{2\text{MAX}}$, oppure nel caso in cui siano previste frequenti inversioni del moto, applicare sulle superfici di accoppiamento un prodotto adesivo adeguato per il bloccaggio.

L'installazione deve essere eseguita in modo da curare l'allineamento tra il riduttore e l'albero da comandare, oppure tra il riduttore e il motore in tutti i casi in cui il motore non sia direttamente flangiato al riduttore stesso.

Un accorgimento molto importante, al fine di evitare che le flange di sostegno dei riduttori vengano messe in tensione già in fase di montaggio, consiste nell'assicurarsi che la controflangia di fissaggio aderisca perfettamente alla flangia del riduttore prima del serraggio delle viti di fissaggio.

Sui riduttori E160 ed E260 Versioni maschio, è raccomandato l'utilizzo di entrambi i centraggi sul supporto uscita; in caso contrario contattare il referente Dana di zona.

Viti di fissaggio

Utilizzare, per il fissaggio dei riduttori, viti di classe 10.9 con rosette ISO 7089 (300 HV min.)

Le viti devono essere serrate, in funzione delle loro dimensioni, secondo le coppie indicate nelle tabella dimensionali delle diverse grandezze: i valori delle coppie di serraggio sono riferite a viti nelle condizioni di fornitura, ovvero con rivestimento superficiale di fosfatazione.

Evitare di lubrificare le viti prima del serraggio in quanto la conseguente variazione di coefficiente di attrito superficiale potrebbe causare un sovraccarico delle viti al momento del serraggio.

Verificare sempre la coppia di serraggio delle viti dopo le prime ore di funzionamento della macchina.

Before installation, clean and degrease the mating surfaces thoroughly, removing any traces of paint. If the maximum torque to be transmitted is higher than $0.7 \times T_{2\text{MAX}}$, or if frequent reversals are foreseen, apply a suitable adhesive product for clamping on the coupling surfaces.

Installation must ensure the alignment of the gear unit and the shaft to be controlled, or the gear unit and the motor whenever the motor is not directly flanged to the gear unit itself.

A particularly important measure, to prevent stress on the support flanges of the gear units even in the assembly phase, is to ensure that the mounting counter-flange adheres perfectly to the gear unit flange before tightening the fixing screws.

For E160 and E260 male versions gearboxes it is recommended to use both the spigots on the output support; otherwise consult the Dana area contact person.

Fixing screws

Use class 10.9 screws with washers ISO 7089 (300 HV min.) for mounting the gear units

The screws must be tightened (depending on their size) according to the torque values given in the dimensional table of the various sizes: the tightening torque values refer to screws in the conditions of supply, or with phosphate coating.

Do not lubricate the screws before tightening, as the consequent variation in coefficient of surface friction could cause an overload on tightening.

Always check the tightening torque of the screws after the first hours of machine operation.

Vor der Installation Kontaktflächen reinigen und entfetten, eventuelle Lackspuren entfernen. Liegt das zu übertragende Drehmoment über $0.7 \times T_{2\text{MAX}}$ oder sind häufige Änderungen der Drehrichtung des Motors vorgesehen, geeignetes Haftmittel für die Befestigung auf die Kontaktflächen aufbringen.

Ist der Motor nicht direkt am Getriebe angeflanscht, besonders auf die Ausrichtung von Getriebe und der zu steuernden Welle bzw. von Getriebe und Motor achten.

Wichtiger Hinweis: Um zu vermeiden, dass die Befestigungsflasche der Getriebe schon beim Einbau unter Spannung stehen darauf achten, dass die Gegenflansche für die Befestigung korrekt am Getriebeflansch vor dem Anziehen der Befestigungsschrauben anliegen.

Für die Getriebe E160 und die männliche Version von E260 ist es empfohlen beide Zentrierungen der Ausgangslagerung zu verwenden; andernfalls wenden sie sich an die Dana Kontaktperson der zone zu wenden.

Befestigungsschrauben

Für die Befestigung der Getriebe Schraubenklasse 10.9 mit Unterlegscheiben ISO 7089 (300 HV min.) verwenden

Die Schrauben sind entsprechend ihrer Abmaße nach den in den Größen Tabellen der verschiedenen Baugrößen angegebenen Anzugsmomenten anzuziehen: Die angegebenen Werte für das Anzugsmoment beziehen sich auf Schrauben im Lieferzustand bzw. auf phosfatisierte Schrauben.

Schrauben vor dem Anziehen nicht schmieren, da die sich daraus ergebende Änderung des Abriebkoeffizienten zu einer Überbelastung beim Anziehen der Schrauben führen können.

Immer nach einigen Betriebsstunden das Anzugsmoment der Schrauben überprüfen.

21. GIUNTO AD ATTRITO

I giunti ad attrito sono montati sull'albero di uscita dei supporti tipo FS.

Riportiamo di seguito le caratteristiche e gli accorgimenti da considerare per un corretto montaggio e smontaggio di questi organi ai quali è affidata la trasmissione del moto.

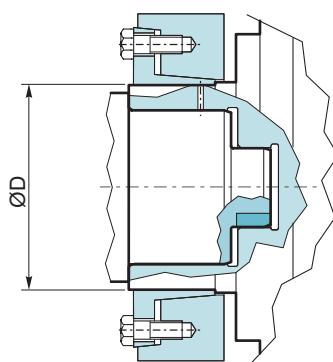

Fig. (19)

* In presenza di carichi assiali la coppia trasmissibile T_{GN} dovrà essere ridotta. Contattare il referente DANA di zona.

21. SHRINK DISC

The shrink discs are fitted on the output shaft of FS type supports.

Given below are the characteristics and measures to be considered for correct assembly and disassembly of these parts used for the transmission of motion.

21. REIBUNGSKUPPLUNG

Die Reibungskupplungen sind auf den Abtriebskonfigurationen FS montiert.

Im Folgenden werden die Merkmale und die Anweisungen aufgeführt, die beim Ein- und Ausbau dieser Organe zur Bewegungsübertragung zu berücksichtigen sind.

	T_{2N} [Nm]	D [mm]	$*T_{GN}$ [Nm]	Tipo di giunto Coupling Type Kupplungsart	Codice DANA DANA code Code DANA
E10	1'200	ø62	2'710	3009 62x110	9019090
E16	1'800	ø62	2'870	3009 62x110	9019090
E25	2'900	ø100	9'930	3009 100x170	9019152

E260	26'000	ø175	54'800	3009 175x300	9022752

Tab. (28)

T_{2N} = Coppia nominale riduttore / Gear unit nominal torque / Nenndrehmoment Getriebe

* T_{GN} = Coppia massima del giunto / Maximum torque of the coupling / Max. Drehmoment der Kupplung

D = Diametro giunto d'attrito / Hub diameter / Wellendurchmesser

* In case of axial loads, the transmissible torque T_{GN} should be reduced. Consult the DANA area contact person.

* Bei Axiallasten muss das übertragbare Drehmoment T_{GN} verringert werden. Wenden Sie sich an die DANA Kontaktperson der zone zu wenden.

Montaggio

Assembly

Einbau

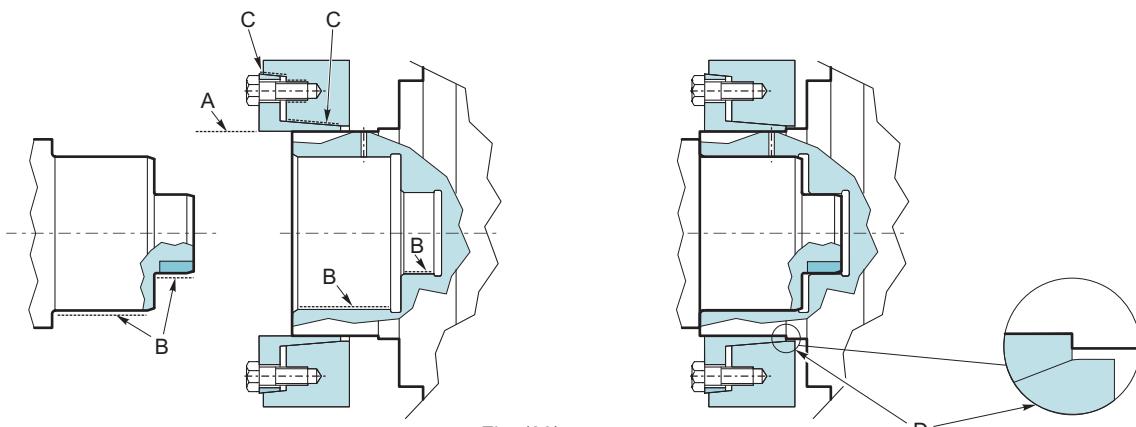

Fig. (20)

1. Pulire e sgrassare accuratamente l'albero e la sua sede (Fig.20 punti B). Per facilitare i successivi smontaggi, è consigliabile realizzare il centraggio piccolo dell'albero mediante una bronzina opportunamente lavorata (Fig. 20).

2. Lubrificare la sede del giunto (Fig.20 punto A) con grasso al bisolfuro di molibdeno (MoS_2). Quando è nuovo, non occorre smontare il giunto per ingrasstrarlo. Solo in caso di ripristino di un giunto usato, è consigliabile ingrassare le zone C.

3. Montare il giunto sul riduttore senza serrare le viti. Se la posizione di montaggio è verticale ed il relativo albero è rivolto verso il basso, assicurarsi che il giunto non possa sfilarlo e cadere. In tutti i casi, non serrare mai le viti prima di avere infilato l'albero nella sua sede.

1. Thoroughly clean and degrease the shaft and its seat (Fig.20 B). To facilitate subsequent disassembly, it is advisable to create the shaft's small spigot by means of a suitably machined bushing (Fig. 20).

2. Lubricate the seat of the coupling (Fig.20 A) with molybdenum disulfide grease (MoS_2). When new, the coupling does not have to be disassembled for greasing. Greasing of areas C is advisable only when reinstalling a used coupling.

3. Fit the coupling on the gear unit without tightening the screws. If the mounting position is vertical and the respective shaft is facing downward, make sure the coupling cannot slip off and fall. In all cases, never tighten the screws before fitting the shaft in its seat.

1. Die Welle und ihre Aufnahme sorgfältig reinigen und entfetten (Abb.20 Punkt B). Um den späteren Ausbau zu erleichtern, sollte die Welle mittels eines passend bearbeiteten Gleitlagers zentriert werden (Abb. 20).

2. Sitz der Kupplung (Abb. 20 Punkt A) mit Molybdändisulfid-Fett schmieren (MoS_2). Eine neue Kupplung braucht zum Einfetten nicht ausgebaut zu werden. Nur bei Überholung einer gebrauchten Kupplung muss der Bereich C geschmiert werden.

3. Kupplung an das Getriebe bauen ohne dabei in die Schrauben anzuziehen. Bei vertikalem Einbau mit nach unten gerichteter Welle ist sicher zu stellen, dass die Kupplung fest sitzt und nicht herausfallen kann. Auf keinen Fall die Schrauben festziehen, bevor die Welle in die eigene Aufnahme eingeführt ist.

4. Inserire l'albero nella sua sede. Il montaggio deve avvenire senza interferenza alcuna e questo è possibile solo con un preciso allineamento fra riduttore e albero realizzabile mediante l'ausilio di opportune attrezzature di sollevamento.

ATTENZIONE!

Il montaggio deve essere effettuato senza applicare forze assiali, colpi o urti che potrebbero danneggiare i cuscinetti del riduttore.

5. Posizionare il giunto fino all'arresto contro lo spallamento appositamente previsto sull'albero (Fig.20 punto D) prima di iniziare a serrare le viti.

6. Avvitare progressivamente le viti in sequenza, secondo uno schema circolare, con opportuna chiave dinamometrica, scelta secondo la distanza "X" di progettazione (Fig. 21) e tarata alla coppia di serraggio indicata nella tabella sottostante. Effettuare l'ultima ripresa tarando la chiave ad una coppia più alta del 3-5% rispetto a quella indicata.

Tarare nuovamente la chiave alla coppia indicata in tabella ed assicurarsi che nessuna vite possa essere ulteriormente avvitata, in caso contrario ripetere la procedura dal punto 5. Il montaggio è completo e corretto se le superfici frontali dell'anello interno ed esterno si trovano sullo stesso piano (Fig.21 punto W).

Non è necessario ricontrillare la coppia di serraggio dopo l'entrata in servizio del giunto.

7. Proteggere la zona del giunto con opportuno carter in lamiera, (Fig.21 punto P) se si prevede che pietre, sabbia o altro materiale possano danneggiare il giunto o le guarnizioni di tenuta del riduttore.

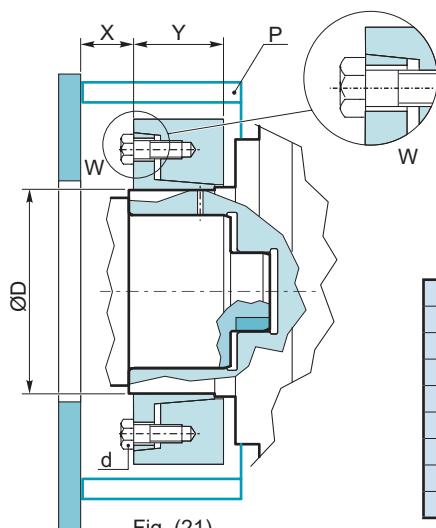

Fig. (21)

4. Fit the shaft in its seat. Assembly must occur without any interference, and this is only possible with exact gear unit/shaft alignment, carried out with the aid of suitable lifting equipment.

4. Die Welle in ihren Sitz einsetzen. Der Einbau muss problemlos erfolgen, Getriebe – und Welle müssen dazu perfekt ausgerichtet sein. Das ist nur mit geeignetem Hubmittel möglich.

CAUTION!

Assembly must be carried out without applying axial forces, blows or impacts that could damage the gear unit bearings.

5. Position the coupling until it stops against the shoulder on the shaft (Fig.20 D) before tightening the screws.

6. Tighten the screws gradually in a circular order, using a suitable torque wrench chosen according to design distance "X" (Fig. 21) and adjusted to the torque given in the table below. Carry out final tightening, setting the wrench to a torque of 3-5% higher than that indicated.

Set the wrench to the torque specified in the table and make sure that no screws can be further tightened, otherwise repeat the procedure from point 5. Assembly is complete and correct if the front surfaces of the inner and outer ring are on the same level (Fig.21 W).

The tightening torque does not have to be rechecked after the coupling is put into service.

7. Protect the coupling area with the special sheet casing, (Fig.21 P) if there is the risk of stones, sand or other material that damaging the coupling or the gear unit seals.

ACHTUNG!

Bei der Montage keine Axialkräfte oder Schläge und Stöße anwenden, die die Getriebelager beschädigen können.

5. Kupplung in den auf der Welle ausgeführten Absatz (Abb. 20 Punkt D) vor dem Anziehen der Schrauben drücken.

6. Die Schrauben nacheinander reihum mit einem Drehmomentschlüssel anziehen, der je nach dem Abstand der Projektvorgaben "X" (Abb. 21) auszuwählen und auf das in der nachstehenden Tabelle angegebene Anzugsmoment einzustellen ist. Noch einmal nachziehen und dafür den Schlüssel auf ein Anzugsmoment einstellen, das 3-5% höher als das angegebene ist. Den Schlüssel wieder auf das in der Tabelle angeführte Anzugsmoment einstellen und sich vergewissern, dass es danach nicht möglich ist, die Schrauben weiter anzuziehen; andernfalls ist das Verfahren ab Punkt 5 zu wiederholen. Der Einbau ist vorschriftsmäßig ausgeführt, wenn sich die gegenüberliegenden Flächen des Innen- und Außenringes auf derselben Ebene befinden (Abb. 21 Punkt W).

Nach der Inbetriebnahme der Kupplung braucht das Anziehmoment nicht erneut kontrolliert zu werden.

7. Falls Gefahr besteht, dass Steine, Sand oder anderes Material die Kupplung oder die Getriebedichtungen beschädigen können, ist der Kuppungsbereich durch eine geeignete Blechverkleidung zu schützen (Abb. 21, Punkt P).

Tab. (29)

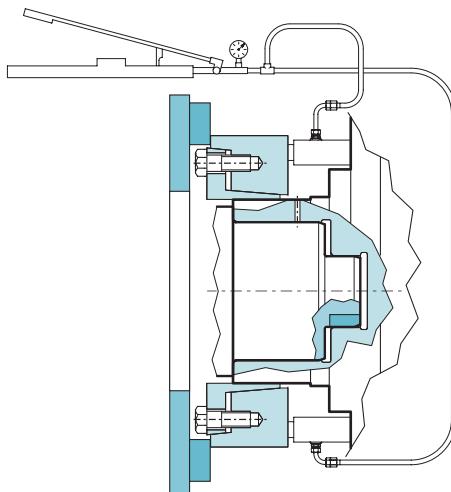

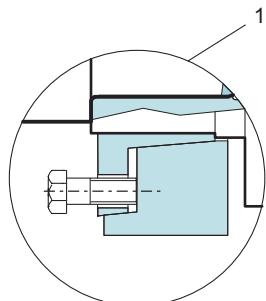

Fig. (22)

1. Allentare le viti in sequenza e in più riprese, fino a che il giunto si possa muovere sul mozzo.

ATTENZIONE!

Non svitare completamente le viti fino a quando gli anelli non si siano separati spontaneamente. Le elevate forze assiali potrebbero causare uno smontaggio violento, con conseguente pericolo per gli operatori.

2. Nel caso gli anelli non si separassero spontaneamente dopo avere allentato le viti, trasferirne alcune nei fori di estrazione dell'anello interno (Fig. 22 dettaglio 1) e avvitandole, separare quest'ultimo dall'anello esterno.

3. Utilizzando adeguate attrezzature per il sostegno del riduttore, separare il riduttore dall'albero della macchina. Se tale metodo non fosse sufficiente a liberare il riduttore, si consiglia di utilizzare appositi spintori idraulici, che agiscano fra il supporto e la struttura della macchina (Fig. 22). E' necessario che la forza esercitata dagli spintori non sia superiore ai valori riportati nella tabella sottostante:

1. Loosen the screws gradually and in order, until the coupling can move on the hub.

CAUTION!

Do not undo the screws completely until the rings separate on their own. High axial forces could cause a violent removal, with subsequent danger for operators.

2. If the rings do not separate on their own after loosening the screws, fit some of them in the extraction holes of the inner ring (Fig. 22 detail 1) and, screwing them, separate the inner ring from the outer ring.

3. Using appropriate equipment to support the gear unit, separate the gear unit from the shaft of the machine. If this method is not sufficient to free the gear unit, it is advisable to use special hydraulic pushers that act between the support and the structure of the machine (Fig. 22). The force exerted by the pusher must not exceed the values given in the table below:

1. Die Schrauben nacheinander in mehreren Durchgängen lockern, bis die Kupplung auf der Nabe bewegt werden kann.

ACHTUNG!

Die Schrauben erst völlig herausdrehen, wenn sich die Ringe selbstständig trennen. Die beträchtlichen Axialkräfte können zu einem heftigen und für die Arbeitskräfte gefährlichen Abreißen führen.

2. Falls sich die Kupplungsringe nach dem Entfernen der Schrauben nicht von selbst lösen sollten, einige Schrauben in die Abzugsbohrungen des Innenrings einsetzen (Abb. 22, Ausschnitt 1) und durch Festziehen derselben den Innen- vom Außenring trennen.

3. Zur Halterung des Getriebes geeignete Werkzeuge benutzen, Getriebe von der Welle der Maschine trennen. Sollte dieses Verfahren nicht ausreichen, wird zum Einsatz eines Hydraulikschiebers geraten, der zwischen Halterung und Maschinengehäuse (Abb. 22) wirkt. Dabei darf die Kraft des Schiebers nicht über den in der nachstehenden Tabelle aufgeführten Werten liegen:

Carico assiale / Axial load / Achslast [N]								
E10	E16	E25	E30	E50	E80	E120	E160	E260
15'000	24'000	42'000	42'000	42'000	57'000	72'000	90'000	105'000

Tab. (30)

4. Se lo smontaggio del riduttore avvenisse dopo diverso tempo dalla messa in funzione, è necessario rimuovere il giunto dal mozzo, separare gli anelli conici e togliere eventuali residui di sporco o ruggine da tutte le superfici interessate al calettamento.

Prima di installare nuovamente l'unità di bloccaggio, pulirla accuratamente e ripristinare la lubrificazione come indicato nella fig. 20 (punti C).

4. If the gear unit is disassembled quite some time after putting into service, it is necessary to remove the coupling from the hub, separate the tapered rings and clean any residuals of dirt or rust from all the surfaces involved in fitting.

Before refitting the clamping unit, carefully clean it and lubricate as shown in fig. 20 (C).

4. Erfolgt der Ausbau des Getriebes sehr lange nach der Inbetriebnahme, müssen die Kupplung von der Nabe abgezogen und die Kegelringen getrennt werden; anschließend sorgfältig die Oberflächen der drehfesten Verbindung reinigen und eventuellen Schmutz, Rost usw. entfernen. Vor dem Wiedereinbau der Verkeilung dieselbe sorgfältig reinigen und schmieren, wie in der Abbildung 20 (Punkt C) gezeigt wird.

22. BRACCIO DI REAZIONE

Per i riduttori con supporto FS e FCP è previsto il montaggio pendolare sull'estremità dell'albero della macchina azionata. In tal caso il riduttore deve essere ancorato al suolo mediante un braccio di reazione che impedisca la rotazione della carcassa del riduttore attorno al suo asse.

La soluzione ideale prevede l'utilizzo di un braccio di reazione simmetrico che annulla la risultante dei carichi radiali dovuti alla coppia di reazione.

Per dettagli circa l'esecuzione di questo tipo di fissaggio, contattare il referente DANA di zona.

Nel caso in cui sia necessario ricorrere ad un braccio di reazione semplice, di seguito vengono indicate le dimensioni consigliate dei bracci di reazione da utilizzare in funzione della grandezza del riduttore.

22. TORQUE ARM

Mounting on the end of the shaft of the driven machine is foreseen for gear units with FS and FCP supports. In this case the gear unit must be secured to the ground by means of a torque arm preventing the gear unit housing from rotating around its axis.

The ideal solution would be a symmetrical torque arm that cancels the resultant of the radial loads due to the reaction torque.

For details about the execution of this type of mounting, consult the DANA area contact person.

If a single torque arm is required, given below are the recommended dimensions of the torque arm to be used depending on the size of the gear unit.

22. DREHMOMENT-STÜTZE

Die Getriebe mit Wellenkonfiguration FS und FCP werden auf die Welle der angetriebenen Maschine aufgesteckt. In diesem Falle muss das Getriebe am Boden mit einer Drehmomentstütze befestigt werden, die verhindert, dass sich das Gehäuse des Getriebes um seine eigene Achse dreht.

Bei dieser Lösung ist eine symmetrische Drehmomentstütze vorgesehen, die die Resultierende aus Radiallasten und Reaktionsmomente aufnimmt.

Einzelheiten mit Bezug auf diese Befestigungsart erfragen sich an die DANA Kontaktperson der zone zu wenden.

Sollte eine einfache Drehmomentstütze notwendig sein, werden nachstehend die empfohlenen Abmaße der Drehmomentstütze entsprechend der Größe des Getriebes angegeben.

Tab. (31)

Montaggio del braccio di reazione

- Il braccio di reazione deve avere libertà di movimento in direzione assiale e gioco sufficiente negli accoppiamenti per consentire al riduttore piccole oscillazioni, sempre presenti, senza nel contempo causare sovraccarichi al riduttore stesso.
Quindi si raccomanda l'impiego di snodi sferici in tutti i collegamenti.
- Si consiglia l'impiego di snodi sferici tipo "long life" con superfici d'attrito protette con PTFE. In alternativa possono essere usati giunti del tipo "acciaio su acciaio", prevedendo la possibilità di una operazione di ingrassaggio periodica.
- La biella di ancoraggio deve essere parallela al braccio di reazione per garantire, a vuoto, il gioco laterale "k" che garantisce libertà di movimento alla struttura in caso di deformazione.
- Il supporto fisso a cui è collegata la seconda estremità della biella deve garantire un ancoraggio adeguato al carico.
- Il braccio di reazione e la relativa biella possono avere soluzioni di progetto diverse da quelle proposte, ma è tassativo rispettare i seguenti accorgimenti:

- Il braccio di reazione deve essere perfettamente dritto
- Se si prevedono pezzi saldati, occorre sabbiare, normalizzare e correggere di macchina utensile eventuali deformazioni
- La superficie di contatto del braccio di reazione in corrispondenza della flangiatura al riduttore deve essere perfettamente piana
- Prima di collegare il braccio di reazione al riduttore, eliminare accuratamente ogni traccia di grasso dalle superfici a contatto.

ATTENZIONE!

Non eseguire alcun lavoro di saldatura che coinvolga il riduttore nemmeno come messa a terra.

- Usare sempre la chiave dinamometrica per serrare le viti di collegamento.

Torque arm assembly

- The torque arm must be free to move axially and have enough play in the couplings to allow small oscillations (always present) of the gear unit, but without causing overloads on the gear unit.
Therefore ball joints must be used in all connections.*
- It is advisable to use long-life ball joints, protecting the rubbing surfaces with PTFE. Alternatively, "steel to steel" type joints can be used, providing for the possibility of periodical greasing.*
- The anchorage connecting rod must be parallel to the torque arm in order to ensure (unloaded) the side clearance "k" which ensures free movement of the structure in case of deformation.*
- The fixed support to which the second end of the connecting rod is connected must ensure adequate anchorage for the load.*
- The torque arm and relevant connecting rod can have different design solutions from those proposed, but the following arrangements must be respected:*
 - The torque arm must be perfectly straight*
 - If welded parts are provided for, any deformations must be sanded, normalized and machine tool corrected*
 - The contact area of the torque arm at the adapter on the gear unit must be perfectly flat*
 - Before connecting the torque arm to the gear unit, carefully remove all traces of grease from the contact surfaces.*

CAUTION!

Do not carry out any welding work involving the gear unit, or even grounding.

- Always use a torque wrench to tighten the connection screws.

Montage der drehmomentstütze

- Die Drehmomentstütze muss sich in axialer Richtung frei bewegen können und ausreichend Spiel in den Passungen haben, damit kleine Schwankungen beim Getriebe möglich sind, jedoch ohne das Getriebe zu überlasten.
Daher wird der Einsatz von Kugelgelenken empfohlen.
- Am besten geeignet sind "langlebige" Kugelgelenke mit durch PTFE geschützten Reibungsfächern. Alternativ können Gelenke des Typs "Stahl auf Stahl" verwendet werden, die jedoch regelmäßig geschmiert werden müssen.
- Die Verbindungsstange muss parallel zur Drehmomentstütze liegen, damit lastfrei das seitliche Spiel „k“ gegeben ist, das die Bewegungsfreiheit der Struktur bei Verformung gewährleistet.
- Die feste Lagerung des anderen Endes der Verbindungsstange muss eine angemessene Lastverankerung garantieren.
- Die Drehmomentstütze und die Verbindungsstange können andere Projektlösungen als die beschriebene aufweisen, müssen jedoch in jedem Fall die folgenden Bedingungen einhalten:
 - Die Drehmomentstütze muss perfekt gerade sein
 - Bei Schweißstellen müssen eventuelle Verformungen sandgestrahlt, normalisiert und mit Werkzeugmaschinen nachgearbeitet werden
 - Die Kontaktfläche der Drehmomentstütze auf Höhe der Flanschverbindung mit dem Getriebe muss perfekt eben sein
 - Vor der Verbindung der Drehmomentstütze mit dem Getriebe sorgfältig alle Fettrückstände von den Kontaktflächen entfernen.

ACHTUNG!

Keine Schweißarbeiten am Getriebe ausführen, nicht einmal für die Erdung.

- Verwenden Sie beim Anziehen der Schrauben immer den Drehmomentschlüssel.

7. La fig. 23 fornisce un esempio indicativo, poiché la configurazione corretta dipende dal senso di rotazione del riduttore. Infatti, durante il lavoro, è consigliabile che la biella risulti in trazione e non in compressione: la figura di pag. B21 indica, a tale proposito, il senso di rotazione preferenziale affinché tale condizione sia verificata.
Se necessario, eseguire il montaggio del braccio di reazione dal lato opposto a quello riportato in Fig. 23.
- In caso di necessità, a causa di ingombri specifici, la biella può essere montata verso l'alto.
8. Quando si esegue un montaggio di tipo pendolare, occorre ricordare che i pesi del riduttore, del braccio di reazione e di tutti gli elementi ad essi collegati, inducono carichi e momenti ribaltanti che vengono sopportati dai cuscinetti del supporto d'uscita.
Quindi la posizione relativa di tutte le masse che concorrono alla trasmissione della potenza deve essere valutata in sede di progetto al fine di rendere minimo il valore delle risultanti su detti cuscinetti.
Per le stesse ragioni è chiaro che si deve limitare al massimo il peso dei componenti collegati al riduttore, valutando accuratamente gli spessori delle strutture effettivamente necessarie a reggere gli sforzi e decentralizzando tutti gli elementi che non sono funzionali alla trasmissione di potenza.
- Una progettazione impropria, può ridurre la vita dei riduttori causando cedimenti prematuri dei cuscinetti e degli ingranaggi a causa di eccessive deformazioni elastiche degli stadi e determinare la possibilità di slittamento e grippaggio del giunto ad attrito.
7. *Fig. 23 is given only by way of example, since the correct configuration depends on the gear unit rotation direction. In fact, during the work, it is advisable for the connecting rod to be in traction and not compression: the figure on p. B21 shows the preferential direction of rotation so that this condition is met.*
- If necessary, mount the torque arm on the opposite side to that shown in Fig. 23.*
- If necessary, due to specific encumbrance, the connecting rod can be assembled upward.*
8. *When doing a shaft mounting type assembly, remember that the weights of the gear unit, the torque arm and all the elements connected to them create loads and tipping moments that are supported by the output support bearings.*
- Therefore the relative position of all the masses involved in transmitting power must be appraised in the design phase, in order to minimize the resultant value on the bearings.*
- Likewise, the weight of the components connected to the gear unit must be limited as much as possible, carefully appraising the thicknesses of the structures actually necessary for supporting the stresses, and decentralizing all the elements not involved in power transmission.*
- An incorrect design can shorten the life of the gear units, causing early giving of the bearings and gears due to excessive elastic deformation of the stages, with the possibility of the shrink disc slipping and seizing.*
7. Abb. 23 stellt nur ein Beispiel vor, da die genaue Konfiguration immer von der Drehrichtung des Getriebes abhängt. Bei der Ausführung der Arbeiten sollte die Verbindungsstange immer zugbelastet und nicht druckbelastet sein: die Abbildung auf Seite B21 gibt in diesem Zusammenhang die bevorzugte Drehrichtung an, damit sich diese Bedingung einstellt. Nötigenfalls die Drehmomentstütze auf der gegenüberliegenden Seite der in Abb. 23 gezeigten Position anbringen Abb.23.
Bei Bedarf infolge besonderer Abmessungen kann die Schubstange in nach oben gerichteter Stellung montiert werden.
8. In der Aufsteckausführung darf nicht vergessen werden, dass das Gewicht des Getriebes, der Drehmomentstütze und aller damit verbundenen Bauteile Lasten und Kippmomente verursachen, die abtriebseitig auf den Lagern lasten.
- Die Anordnung aller Gewichte, die an der Leistungsübertragung beteiligt sind, muss daher bei der Planung genau bewertet werden, um die Auswirkungen auf die genannten Lager zu minimieren.
Aus denselben Gründen muss das Gewicht der mit dem Getriebe verbundenen Bauteile so weit wie möglich begrenzt werden; dabei ist die Stärke der Strukturen, die effektiv erforderlich ist, um den anfallenden Kräften standzuhalten, zu berücksichtigen und sind alle Elemente, die für die Leistungsübertragung nicht unerlässlich sind, zu verlagern.
Eine schlechte Planung kann die Lebensdauer der Getriebe verkürzen, zu frühzeitigem Nachgeben der Lager und Zahnräder führen infolge von außergewöhnlichen Verformungen der Stufen und das Durchrutschen und Festfressen der Reibungskupplung verursachen.

23. LUBRIFICAZIONE

I riduttori DANA vengono forniti privi di lubrificante; l'utilizzatore è tenuto ad effettuare il corretto riempimento prima della messa in moto della macchina.

Caratteristiche fondamentali degli oli

I parametri importanti da considerare quando si sceglie il tipo di olio sono:

- la viscosità alle condizioni nominali di funzionamento
- gli additivi

Lo stesso olio deve lubrificare sia i cuscinetti che gli ingranaggi e tutti questi componenti coesistono all'interno della stessa scatola, in condizioni di funzionamento diverse.

Viscosità

La viscosità nominale è riferita ad una temperatura di 40 °C, ma diminuisce velocemente all'aumentare della temperatura. Se la temperatura di funzionamento del riduttore è compresa tra 50 °C e 70 °C, si può scegliere una viscosità nominale secondo la seguente tabella indicativa, adottando la viscosità più elevata quando si prevede la temperatura di lavoro più elevata.

Velocità in uscita Output speed Abtriebsdrehzahl n_2 [rpm]	Temperatura di lavoro Operating temperature Betriebstemperatur	
	50° C	70° C
$n_2 \geq 20$	VG 150	VG 220
$5 < n_2 < 20$	VG 220	VG 320
$n_2 \leq 5$	VG 320	VG 460

Tab. (32)

Particolare attenzione bisogna fare agli stadi in uscita molto caricati e con velocità molto basse (< 1 rpm). In questi casi bisogna ricorrere sempre ad oli con viscosità elevata e con una buona carica di additivazione Extreme Pressure (EP).

Additivi

Oltre ai normali additivi antischiuma ed antiossidanti, è importante utilizzare oli lubrificanti con additivi in grado di conferire proprietà EP (extreme pressure) ed anti-usura, secondo ISO 6743-6 L-CKC o DIN 51517-3 CLP. Occorre ricercare prodotti con caratteristiche EP tanto più marcate quanto più ridotta è la velocità in uscita del riduttore. È opportuno ricordare che i composti chimici sostitutivi della lubrificazione idrodinamica si formano a scapito della carica EP originale.

Quindi, in presenza di velocità molto basse e carichi elevati, è importante rispettare gli intervalli di manutenzione per non deprimere eccessivamente le caratteristiche lubrificanti dell'olio.

23. LUBRICATION

DANA gear units are supplied without lubricant; therefore the user must carry out correct filling before starting the machine.

Fundamental characteristics of the oils

The important parameters to consider when choosing the type of oil are:

- viscosity at nominal operating conditions
- additives

The same oil must lubricate the bearings and the gears and all these components work inside the same box, in different operating conditions.

Viscosity

Nominal viscosity refers to a temperature of 40 °C, but rapidly decreases as the temperature increases. If the gear unit operating temperature is between 50°C and 70°C, a nominal viscosity can be chosen according to the following guide table, choosing the highest viscosity if the highest operating temperature is foreseen.

Die DANA - Getriebe werden ohne Schmieröl geliefert; der Benutzer muss dieselben vor der Inbetriebnahme der Maschine mit der vorschriftmäßen Schmierölmenge füllen.

Grundlegende Schmieröleigenschaften

Bei der Schmierölauswahl sind die folgenden wichtige Parameter zu berücksichtigen:

- Viskosität bei Nennbetriebsbedingungen
- Additive

Dasselbe Öl muss sowohl Lager wie auch Zahnräder schmieren und diese Bauteile funktionieren zusammen in demselben Gehäuse unter unterschiedlichen Betriebsbedingungen.

Viskosität

Die Nennviskosität bezieht sich auf eine Temperatur von 40 °C und nimmt mit der Zunahme der Temperatur rasch ab. Liegt die Betriebstemperatur des Getriebes zwischen 50 °C und 70 °C, kann eine Nennviskosität laut folgender Tabelle gewählt werden, wobei bei sehr hoher Temperatur die höchste Viskosität zu wählen ist.

Special attention must be paid to very loaded output stages and with very low speeds (<1 rpm). In such cases, always use high viscosity oils and with a good amount of Extreme Pressure (EP) additive.

Additives

In addition to the normal antifoaming and antioxidant additives, it is important to use lubricating oils with additives that provide EP (extreme pressure) and antiwear properties, according to ISO 6743-6 L-CKC or DIN 51517-3 CLP. The lower the gear unit output speed the more marked the EP characteristics of the products have to be. It should be remembered that the chemical compounds replacing hydrodynamic lubrication are formed to the detriment of the original EP load.

Therefore, with very low speeds and high loads it is important to respect the maintenance intervals so as not to excessively diminish the lubricating characteristics of the oil.

Besonders vorsichtig muss man bei Abtriebstufen unter hohen Lasten und mit niedriger Drehzahl (<1 rpm) sein. In diesen Fällen muss immer Schmieröl mit hoher Viskosität und einer ausreichenden Menge an Extreme-Pressure-Additiven (EP) eingesetzt werden.

Additive

Neben den normalen Entschäumern und Oxidationshemmern müssen Schmieröle EP-Additive (Extrem-Pressure) und verschleißhemmende Wirkstoffe laut ISO 6743-6 L-CKC oder DIN 51517-3 CLP enthalten. Der Einsatz von Produkten mit höheren EP-Eigenschaften ist umso wichtiger, je niedriger die Drehzahl abtriebseitig ist. Es wird daran erinnert, dass sich die chemischen Substitutionsverbindungen der hydrodynamischen Schmierung zu Lasten des ursprünglichen EP-Gehalts bilden.

Es ist daher bei sehr niedrigen Drehzahlen und hohen Belastungen sehr wichtig, dass die Wartungszeiträume zur Vermeidung einer übermäßigen Verschlechterung der Schmieröleigenschaften genau eingehalten werden.

Tipi di oli

Gli oli disponibili appartengono generalmente a tre grandi famiglie.

- Oli minerali
- Oli sintetici a base di Poli-Alfa-Olefine (PAO)
- Oli sintetici a base di Poli-Alchilen-Glicole (PAG)

La scelta più appropriata è generalmente legata alle condizioni di impiego.

I riduttori non particolarmente caricati, con un ciclo di impiego discontinuo senza escursioni termiche importanti, possono essere lubrificati con olio minerale. Nei casi di impiego gravoso, quando i riduttori saranno prevedibilmente caricati molto ed in modo continuativo, con conseguente prevedibile innalzamento della temperatura, è bene utilizzare lubrificanti sintetici a base di Poli-Alfa-Olefine.

Non è consentito l'uso di oli a base di Poli-Alchilen-Glicole in quanto non sono compatibili con gli altri oli e sono invece spesso completamente miscibili con l'acqua: questo fenomeno è particolarmente pericoloso poiché non si nota, ma deprime velocemente le caratteristiche lubrificanti dell'olio. Inoltre, questi lubrificanti possono essere chimicamente attivi nei confronti delle tenute olio e delle vernici interne del riduttore.

Oltre a questi già menzionati, ricordiamo che esistono gli oli idraulici e gli oli per l'industria alimentare.

I primi vengono usati per il comando dei freni negativi.

I secondi trovano specifico impiego nell'industria alimentare in quanto sono prodotti speciali non nocivi alla salute.

A seguire vengono riportate tabelle di lubrificanti, proposti dai produttori più noti, con caratteristiche adeguate alla lubrificazione dei riduttori DANA.

Contaminazione

Durante il normale funzionamento, a causa del rodaggio delle superfici, è inevitabile che si trasferiscano nell'olio delle microparticelle metalliche.

Questa contaminazione può ridurre la vita dei cuscinetti, mandando in avaria prematura il riduttore.

Per limitare e controllare il fenomeno, senza ricorrere a frequenti e costosi cambi d'olio, occorre prevedere l'impiego di un opportuno sistema ausiliario di circolazione con filtrazione e raffreddamento dell'olio.

Con questo sistema, si ottiene il doppio vantaggio di controllare il livello di contaminazione attraverso l'impiego di appositi filtri e di stabilizzare la temperatura di funzionamento al livello più adeguato per garantire la viscosità voluta.

Types of oils

The oils available generally belong to three large families.

- Mineral oils
- Polyalphaolefin (PAO) synthetic oils
- Polyalkylene glycol (PAG) synthetic oils

The most suitable choice is generally tied to the conditions of use.

Gear units that are not particularly loaded and with a discontinuous operating cycle, without considerable temperature ranges, can be lubricated with mineral oil.

In cases of heavy use, when the gear units are very loaded and in a continuous way, with resultant temperature increase, it is best to use polyalphaolefin synthetic lubricants.

The use of polyalkylene glycol oils is not allowed as they are not compatible with other oils and are often completely mixable with water: this phenomenon is particularly dangerous because it is not noticed, but rapidly diminishes the lubricating properties of the oil. Moreover, these lubricants can be chemically active against the oil seals and paint inside the gear unit.

In addition to the above, there are also hydraulic oils and oils for the food industry.

The former are used for the command of negative brakes.

The latter have a specific use in the food industry since they are special products that are not harmful to the health.

Given below are tables of lubricants, proposed by the best-known producers, with characteristics suitable for the lubrication of DANA gear units.

Contamination

During normal operation, due to running-in of the surfaces, metallic microparticles will inevitably form in the oil.

This contamination can shorten the life of the bearings, resulting in early breakdown of the gear unit.

To limit and control this phenomenon, without resorting to frequent and costly oil changes, a suitable auxiliary oil circulation system with filtering and cooling of the oil must be provided.

This system offers the dual advantage of controlling the level of contamination through the use of special filters and stabilizing the operating temperature at a level more suitable for ensuring the required viscosity.

Schmierölsorten

Die verfügbaren Ölsorten gehören allgemein zu drei großen Familien.

- Mineralöle
- Synthetische Öle auf der Basis von Polyalphaolefinen (PAO)
- Synthetische Öle auf der Basis von Polyalkylenglykolen (PAG)

Die Auswahl hängt im Allgemeinen von den Einsatzbedingungen ab.

Getriebe, die nicht im Dauerbetrieb laufen und keinen großen Belastungen und großen Temperaturschwankungen ausgesetzt sind, können mit Mineralölen geschmiert werden.

Bei Einsatz unter erschwerten Bedingungen, bei denen die Getriebe voraussichtlich hohen Lasten im Dauerbetrieb mit der entsprechenden voraussehbaren Temperaturerhöhung ausgesetzt sind, ist es angebracht, synthetische Polyalphaolefin-Öle zu verwenden.

Verboten ist die Verwendung von Ölen auf der Basis von Polyalkylenglykolen, da sie nicht mit anderen Ölen kompatibel sind, aber oft mit Wasser gemischt werden können: dieses Phänomen ist besonders gefährlich, da es nicht festgestellt werden kann, verschlechtert aber schnell die Schmiereigenschaften des Öls. Darüber hinaus können diese Öle zu chemischen Reaktionen bei Oldichtungen und den Innenanstrichen des Getriebes führen.

Neben den erwähnten Ölen gibt es noch Hydrauliköl und Öle für die Lebensmittelindustrie.

Die ersten werden auf Negativbremsen eingesetzt.

Letztere werden von der Lebensmittelindustrie verwendet, da sie nicht gesundheitsschädlich sind.

Im Folgenden finden Sie Schmiermitteltabellen der bekanntesten Hersteller mit entsprechenden Eigenschaften für die Schmierung von DANA-Getrieben.

Verschmutzung

Während des normalen Betriebs entstehen durch den Abrieb der Oberflächen Mikrometallpartikel im Öl.

Diese Verschmutzung kann die Lebensdauer der Lager verkürzen und zu einem Ausfall des Getriebes führen.

Zur Einschränkung dieser Erscheinung ohne häufigen und kostspieligen Ölwechsel ist der Einbau einer zusätzlichen Filteranlage für das Schmieröl mit Ölfilter- und Ölkühlvorrichtung empfehlenswert.

Diese Anlage bietet den doppelten Vorteil, einseitig den Grad der Ölverschmutzung zu reduzieren und andererseits die Betriebstemperatur auf einer für die gewünschte Viskosität geeigneten Temperaturstufe zu stabilisieren.

Per problemi di lubrificazione di riduttori destinati a impieghi particolari, relativamente alla tipologia costruttiva o ai parametri di funzionamento, è consigliabile contattare il referente DANA di zona.

For lubrication problems with gear units intended for particular uses, regarding the construction type and operating parameters, it is advisable to consult the DANA area contact person.

Wenden Sie sich bei Schmierproblemen von Getrieben, die sowohl bauseitig wie auch aufgrund der Betriebsparameter für besondere Anwendungen vorgesehen sind, direkt an sich an die DANA Kontaktperson der zone zu wenden.

CONTROLLO OLIO CON LUBRIFICAZIONE NATURALE

Montaggio orizzontale

Posizione livelli

Nel caso di montaggio orizzontale del riduttore, il normale livello per garantire una corretta lubrificazione è posto sulla mezzeria, Fig. 24. Per applicazioni con velocità di rotazione in uscita molto bassa ($n_2 \leq 5$ rpm) è consigliabile fissare il livello ad una quota superiore di 25 - 50 mm, Fig. 25.

E' possibile verificare con facilità il corretto livello utilizzando un tubo trasparente posizionato come da Fig. 25.

Nel caso in cui la velocità di uscita sia estremamente bassa ($n_2 \leq 1$ rpm), oppure se sono prevedibili lunghi periodi di fermo del riduttore, è consigliabile riempire tutta la scatola. In questo caso occorre prevedere l'impiego di un apposito serbatoio ausiliario.

Volendo montare uno strumento che consenta la verifica visiva del livello (o tramite apposito segnale elettrico), occorre eseguire un montaggio secondo lo schema di Fig. 26.

Montare il tappo di sfiato al di sopra dell'indicatore di livello tramite un tubo abbastanza lungo, collegando la parte superiore (vuota) del riduttore appena sotto allo sfiato. In questo modo si eviterà la fuoriuscita di olio.

OIL CONTROL DIAGRAMS WITHOUT AUXILIARY COOLING SYSTEM

Horizontal mounting

Position of levels

With horizontal mounting of the gear unit, the normal level for ensuring correct lubrication is located at the center line. Fig. 24. For applications with very low output rotation speed ($n_2 \leq 5$ rpm) it is advisable to fix the level at a value above 25 - 50 mm, Fig. 25.

The correct level can be easily checked using a transparent tube positioned as shown in Fig. 25.

If the output speed is extremely low ($n_2 \leq 1$ rpm), or if the gear unit will have foreseeable long idle periods, it is advisable to fill the entire box. In this case a special auxiliary tank must be provided.

To fit an instrument for visually checking the level (or by means of a special electric signal), assembly must be done according to the diagram in Fig. 26.

Fit the breather cap above the level indicator via a long enough tube, connecting the upper part (empty) of the gear unit just below the breather. This will prevent the leakage of oil.

HINWEISE FÜR DIE ÖLKONTROLLE OHNE DRUCKSCHMIERUNG

Horizontale Einbaurage

Füllstände

Bei horizontalem Getriebeeinbau liegt der normale Füllstand für eine störungsfreie Schmierung auf der Mittellinie, Abb. 24. Bei Anwendungen mit äußerst niedrigen Abtriebsdrehzahlen ($n_2 \leq 5$ rpm) sollte der Füllstand um 25 - 50 mm höher liegen, Abb. 25.

Der vorschriftsmäßige Füllstand kann leicht mit einem durchsichtigen Schlauch kontrolliert werden siehe Abbildung 25. Bei extrem niedriger Abtriebsdrehzahl ($n_2 \leq 1$ rpm) oder bei voraussichtlichen langen Stillstandzeiten des Getriebes ist es angebracht, das Gehäuse vollständig zu füllen. In diesem Fall ist ein besonderes Zusatzgefäß einzusetzen.

Falls eine Sichtkontrolle des Ölstands (oder eine Kontrolle mittels eines elektrischen Signals) gewünscht wird, muss die Installation laut Schema der Abb. 26 vorgenommen werden.

Die Entlüfterkappe auf dem Füllstandsanzeiger mit einem ausreichend langen Schlauch montieren und den oberen (leeren) Teil des Getriebes knapp unter dem Entlüfter anschließen. Auf diese Weise wird das Austreten von Schmieröl verhindert.

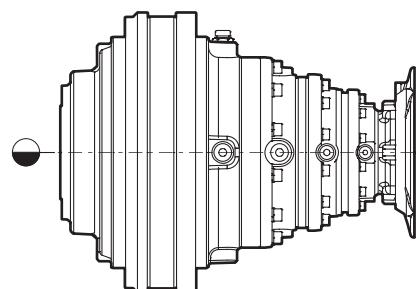

Fig. (24)

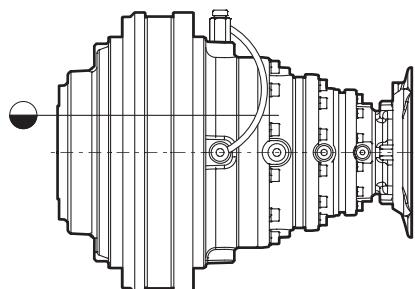

Fig. (25)

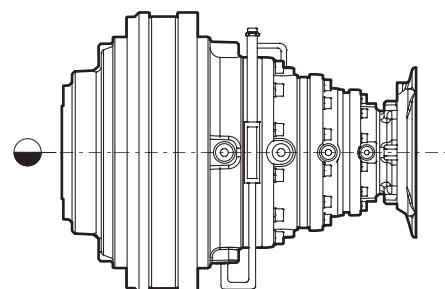

Fig. (26)

Vaso di espansione

Nel caso di montaggio verticale e, comunque, ogni volta si renda necessario riempire completamente il riduttore, occorre rispettare alcune regole (Fig. 27).

All'atto del riempimento, nella parte superiore, in corrispondenza della tenuta rotante dell'albero di uscita, si può formare una bolla d'aria che deve essere eliminata per evitare l'insufficiente lubrificazione della tenuta stessa. Inoltre sapendo che il volume dell'olio aumenta con la temperatura, occorre predisporre un serbatoio ausiliario che consenta all'olio di espandersi senza creare pericolose pressioni interne al riduttore.

Expansion tank

Several rules must be followed with vertical mounting, and in any case whenever the gear unit has to be completely filled (Fig. 27).

During filling, an air bubble can form in the upper part, at the output shaft revolving seal, and which must be eliminated in order to avoid insufficient lubrication of the seal. Also, since the volume of oil increases with the temperature, an auxiliary tank must be provided to allow the oil to expand without creating dangerous pressures inside the gear unit.

Expansionsgefäß

Bei vertikalem Einbau und in allen Fällen, in denen das Getriebe vollständig gefüllt werden muss, sind einige wichtige Regeln einzuhalten (Abb. 27).

Während des Füllens kann sich im oberen Teil in Höhe der Wellendichtung eine Luftblase bilden, die zur Vermeidung ungenügender Schmierung beseitigt werden muss. Da sich das Ölvolume mit steigender Temperatur erhöht, muss ein Hilfsbehälter eingebaut werden, der die Ausdehnung des Öls ausgleicht und gefährliche Drücke im Inneren des Getriebes verhindert.

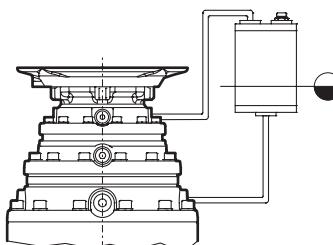

Fig. (27)

Per il dimensionamento occorre determinare il volume V_e di espansione dell'olio alla temperatura di funzionamento:

For dimensioning, the oil expansion volume V_e at operating temperature must be determined:

Für die Bemessung des Behälters muss das Ausdehnungsvolumen V_e des Öls bei Betriebstemperatur berechnet werden:

$$V_e = \frac{V_t \times \Delta T}{1000} \quad [\text{l}] \quad (32)$$

dove

- V_t = volume totale dell'olio contenuto nel riduttore [l]
- ΔT = differenza tra temperatura di funzionamento e temperatura ambiente [$^{\circ}\text{C}$]

La capacità V_s del vaso di espansione è:

where

- V_t = total volume of oil in the gear unit [l]
- ΔT = difference between operating temperature and ambient temperature [$^{\circ}\text{C}$]

The capacity V_s of the expansion tank is:

dabei ist

- V_t = die Gesamtölmenge im Getriebe [l]
- ΔT = der Unterschied zwischen Betriebs- und Umgebungstemperatur [$^{\circ}\text{C}$]

Das Aufnahmevermögen V_s des Expansionsbehälters ist:

$$V_s = 2 \times V_e \quad [\text{l}] \quad (33)$$

Per eliminare l'eventuale aria residua, devono essere collegati il foro presente nella zona più alta del riduttore e la parte superiore del vaso di espansione; quest'ultimo deve essere posto ad un'altezza tale da garantire il pieno riempimento del riduttore al livello minimo.

Si consiglia di realizzare il tubo di spurgo o lo stesso vaso di espansione con materiale trasparente, per poter verificare con facilità l'esatta posizione del livello del lubrificante.

To remove any residual air, the holes in the top part of the gear unit and the upper part of the expansion tank must be connected; the latter must be located at a height ensuring complete filling of the gear unit up to the minimum level.

It is advisable to make the bleeding tube or the expansion tank with transparent material, to be able to easily check the exact position of the lubricant level.

Zur Entlüftung der Restluft ist die Bohrung im höchsten Teil des Getriebes mit dem Oberteil des Expansionsgefäßes zu verbinden; letzteres muss auf einer Höhe angeordnet werden, die gewährleistet, dass das Getriebe immer bis zum Mindeststand gefüllt ist.

Es ist angebracht, einen Entlüftungsschlauch und ein Expansionsgefäß aus durchsichtigem Material zu verwenden, um jederzeit auf leichte Weise den Schmierölstand kontrollieren zu können.

Montaggio verticale in linea e versioni ortogonali

I riduttori debbono essere completamente pieni, quindi occorre montare il vaso di espansione. Come detto in precedenza, è molto importante collegare lo sfiato superiore del riduttore al vaso di espansione per consentire all'olio di risalire fino all'anello di tenuta rotante dell'albero superiore del riduttore.

Volendo montare uno strumento che consente la verifica visiva (o tramite apposito segnale elettrico), lo strumento sarà collocato sul fianco del serbatoio.

Vertical in-line mounting and right-angle versions

The gear units must be completely full, then the expansion tank must be fitted. As already stated, it is very important to connect the top breather to the expansion tank in order to allow the oil to rise up to the rotating seal ring of the gear unit upper shaft.

To fit an instrument for visual checking (or by means of a special electric signal), the instrument must be placed on the side of the tank.

Vertikaleinbau von Koaxial- und Winkelgetrieben

Die Getriebe müssen vollständig gefüllt sein; daher ist immer ein Expansionsbehälter erforderlich. Wie bereits ausgeführt wurde, ist es sehr wichtig, dass die obere Entlüftung des Getriebes an das Expansionsgefäß angeschlossen wird, damit das Schmieröl die Wellendichtung der oberen Getriebewelle erreichen kann.

Falls eine Sichtkontrolle des Ölstands (oder eine Kontrolle mittels eines elektrischen Signals) gewünscht wird, muss das Gerät auf der Seite des Behälters angeordnet werden.

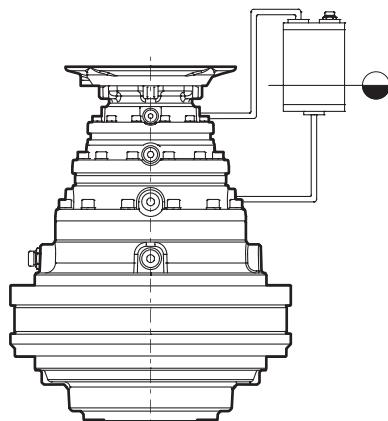

Fig. (28)

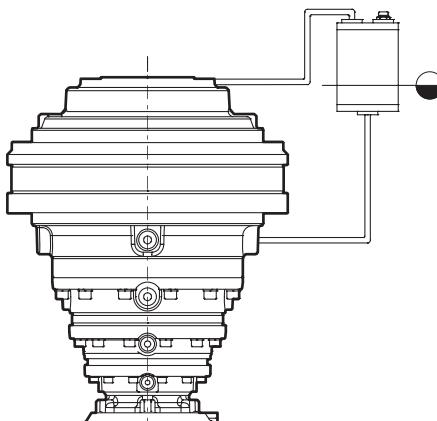

Fig. (29)

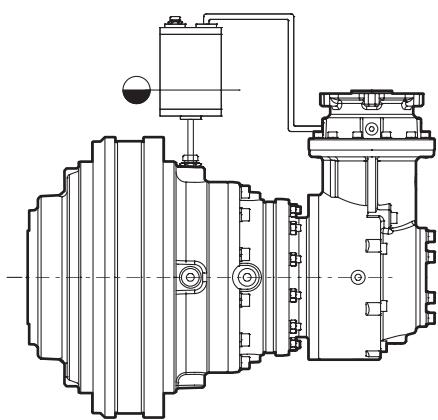

Fig. (30)

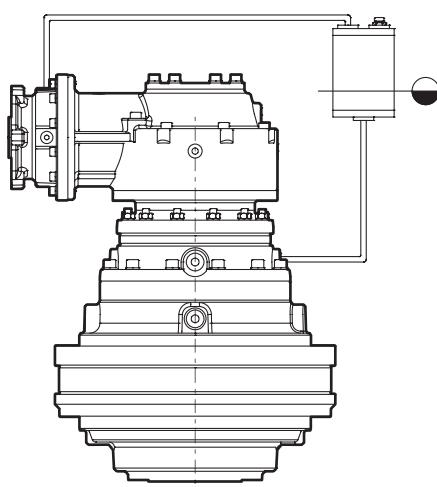

Fig. (31)

CONTROLLO OLIO CON SISTEMA AUSILIARIO DI RAFFREDDAMENTO

Sistemi ausiliari di raffreddamento e filtrazione

Nel caso la potenza applicata sia superiore alla potenza termica dissipabile dal riduttore, è necessario l'impiego di un sistema ausiliario di raffreddamento aria-olio, in grado di smaltire la potenza termica in eccedenza e di mantenere anche un buon livello di pulizia dell'olio lubrificante, attraverso la filtrazione continua.

Per assolvere questa funzione DANA offre diverse tipologie di centraline di raffreddamento: contattare il referente DANA di zona per i dettagli.

Le centraline sono composte da uno scambiatore di calore aria-olio, un filtro, un motore elettrico, una pompa idraulica con valvola di sicurezza e una ventola coassiale e solidale alla pompa.

Volendo montare un sistema ausiliario di tipo diverso diverso, ricordiamo che è assolutamente sconsigliato l'impiego di impianti con serbatoio esterno.

Nel caso in cui si renda necessario un serbatoio ausiliario (per es. per raffreddare più riduttori con un unico impianto) consigliamo di contattare il referente DANA di zona.

Progettando un circuito di circolazione dell'olio è consigliabile aspirare nel punto più basso, così questo ramo del circuito può servire anche a vuotare il riduttore. In ogni caso i punti di aspirazione e manda dell'olio debbono essere sufficientemente lontani tra loro per garantire l'attraversamento del riduttore da parte dell'olio fresco.

Il diametro dei fori di passaggio dell'olio, soprattutto in aspirazione, è molto importante. Infatti, in presenza di fori troppo stretti, la pompa tende a cavitarre. Non potendo modificare la portata della pompa, che è funzione della potenza da smaltire, occorre verificare la capacità dei fori.

Quando si aspira l'olio dai supporti in entrata o dalle flange delle riduzioni veloci, l'impiego di un solo foro può essere insufficiente a smaltire tutta la portata: pertanto occorre collegare 2 o 3 fori mediante un collettore collegato al tubo di aspirazione.

La manda è solitamente meno problematica poiché, nel caso di portata naturale insufficiente, si genera una piccola pressione che garantisce il flusso.

Per un corretto dimensionamento del circuito, si consiglia di seguire le seguenti regole.

OIL CHECK WITH AUXILIARY COOLING SYSTEM

Auxiliary cooling and filtering systems

If the power applied is greater than the thermal power that can be dissipated by the gear unit, an auxiliary cooling system (air-oil) able to dissipate the excess thermal power and also maintain a good level of cleanliness of the lubricating oil through constant filtering, must be used.

To fulfill this function, DANA offers different types of cooling units: consult the DANA area contact person for details. The control units consist of an air-oil heat exchanger, a filter, an electric motor, a hydraulic pump with safety valve and a coaxial fan integral with the pump.

If a different type of auxiliary system is to be fitted, make sure not to use systems with an external tank.

If an auxiliary tank is required (e.g. for cooling several gear units with a single system) it is advisable to consult the DANA area contact person.

In designing an oil circulating circuit it is advisable for suction to be in the lowest point, so that this branch of the circuit can also be used to drain the gear unit. In any case, the oil suction and delivery points must be far enough apart to ensure fresh oil crossing the gear unit.

The diameter of the oil passage is very important, above all in suction. In fact, with too narrow holes, the pump tends to cavitate. Not being able to change the pump delivery, which is a function of the power to be dissipated, the capacity of the holes must be verified.

When sucking oil from input supports or the flanges of the fast gear units, the use of one hole may be insufficient for all the flow: therefore 2 or 3 holes must be connected by means of a manifold connected to the suction pipe.

Delivery is usually less problematic since, in the event of an insufficient natural rate, a small pressure is generated which ensures the flow.

For correct dimensioning of the circuit, it is advisable to follow these rules.

ÖLKONTROLLE BEI ZUSÄTZLICHEN KÜHLSYSTEM

Zusätzliche kühl- und filteranlage

Falls die angelegte Leistung höher ist als die vom Getriebe abführbare Wärmeleistung muss ein zusätzliches Kühlungssystem (Luft-Öl) installiert werden, das in der Lage ist, die überschüssige Wärmeleistung abzuführen und durch Dauerfiltration das Schmieröl auf einem ausreichend sauberen Niveau zu halten.

Zur Lösung dieser Funktion bietet DANA verschiedene Kühlaggregate an: nehmen Sie für Einzelheiten dazu sich an die DANA Kontaktperson der zone zu wenden.

Die Aggregate haben einen Luft-Öl-Wärmetauscher, einen Filter, einen Elektromotor, eine Hydraulikpumpe mit Überdruckventil und einen Koaxiallüfter, der fest mit der Pumpe verbunden ist.

Falls der Einbau eines anderen Hilfssystems gewünscht wird, weisen wir darauf hin, dass auf keinen Fall Anlagen mit externem Behälter eingesetzt werden dürfen.

Falls ein Zusatztank erforderlich sein sollte (um z. B. mehrere Getriebe mit einer einzigen Anlage zu kühlen), wenden Sie sich bitte zuvor an die sich an die DANA Kontaktperson der zone zu wenden.

Bei der Planung einer Ölumlaufschmierung sollte die Ansaugung am niedrigsten Punkt des Kreislaufs angeordnet werden, so dass derselbe auch zum Entleeren des Getriebes dient.

Die Rück- und Vorlaufpunkte des Schmieröls müssen in jedem Fall in einem ausreichenden Abstand von einander angeordnet sein, damit das Frischöl das gesamte Getriebe durchströmen kann.

Der Durchmesser der Bohrungen des Öl durchflusses, extrem wichtig. Bei zu engen Bohrungen tendiert die Pumpe zum Kaviteren. Da die Pumpenfördermenge, die eine Funktion der abzuführenden Leistung ist, nicht geändert werden kann, ist die Kapazität der Durchlässe zu kontrollieren.

Wenn Öl von den Antriebswellen oder den Flanschverbindungen der Schnellgetriebe angesaugt wird, kann die Verwendung einer einzigen Bohrung unzureichend sein, um die gesamte Leistung abzuführen; es ist daher erforderlich, 2 oder 3 Bohrungen mit einer Sammelleitung an das Saugrohr anzuschließen.

Die Druckseite weist weniger Schwierigkeiten auf, da bei unzureichender Fördermenge ein kleiner Druck entsteht, der für den notwendigen Durchfluss sorgt.

Befolgen Sie für eine korrekte Bemessung des Kreislaufs die folgenden Hinweise.

Aspirazione:

- aspirare da più fori quando, usando un solo foro, la velocità dell'olio v_o è superiore a 1.30 m/s;

Mandata:

- mandare in più fori quando, usando un solo foro, la velocità dell'olio v_o è superiore a 2.10 m/s

La velocità può essere dedotta dalla tabella sotto riportata o calcolata mediante la seguente relazione (34):

Suction:

- suck from several holes when, using just one hole, the oil velocity v_o is higher than 1.30 m/s;

Delivery:

- deliver in several holes when, using just one hole, the oil velocity v_o is higher than 2.10 m/s

The velocity can be obtained from the table below, or calculated with the equation (34):

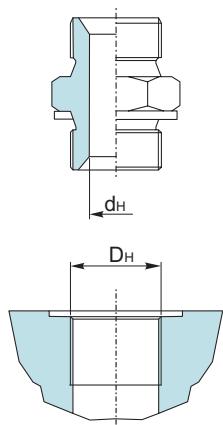

Fig. (32)

$$v_o = \frac{21.2 \times Q_o}{d_H^2} \quad (34)$$

dove:

- v_o = velocità dell'olio [m/s]
- Q_o = portata della pompa [l/min]
- d_H = diametro interno del raccordo [mm]

Nel calcolo viene considerata una viscosità cinematica dell'olio pari a 60 cSt.

where:

- v_o = oil velocity [m/s]
- Q_o = pump delivery [l/min]
- d_H = union internal diameter [mm]

In calculating, a kinematic oil viscosity of 60 cSt is considered.

wobei bedeuten:

- v_o = Ölgeschwindigkeit [m/s]
- Q_o = Pumpenfördermenge [l/min]
- d_H = Innendurchmesser des Anschlusses [mm]

Bei der Berechnung wurde eine kinematische Viskosität des Öls von 60 cSt zu grunde gelegt.

Tabella velocità olio / Oil velocity table / Tabelle Ölgeschwindigkeit					
		v_o [m/s]

Fig. (36)

CAMBIO DELL'OLIO

In assenza di un circuito di filtrazione e raffreddamento, il primo cambio dell'olio deve essere effettuato la prima volta dopo 500-600 ore di funzionamento.

Successivamente si suggeriscono i seguenti intervalli di cambio olio:

OIL CHANGE

In the absence of a filtering and cooling circuit, the first oil change must be done the first time after 500-600 hours of operation.

Subsequently, the following oil change intervals are suggested:

ÖLWECHSEL

Falls kein Filter- und Kühlkreislauf vorhanden ist, muss der erste Ölwechsel nach 500-600 Betriebsstunden erfolgen.

Im Folgenden schlagen wir folgende Ölwechselintervalle vor:

Temperatura olio Oil temperature Öltemperatur [°C]	Intervallo cambio olio / Oil change interval / Ölwechselintervall [h]	
	Olio sintetico Synthetic oil Synthetische Öl	Olio minerale Mineral oil Mineralöl
≤ 65	10'000	4'000
65 ÷ 80	8'000	3'000

Tab. (36)

In caso di applicazioni particolarmente gravose i valori sopra indicati devono essere dimezzati. I valori riportati in tabella si riferiscono ad ambienti di lavoro esenti da contaminazioni esterne.

Si consiglia di compiere l'operazione del cambio olio a riduttore caldo (circa 40 °C), per evitare il depositarsi di mordie e facilitare il completo svuotamento.

Per una corretta procedura attenersi alle norme riportate sul manuale di installazione e manutenzione in dotazione a ogni riduttore.

E' consigliabile un controllo periodico del livello dell'olio.

Nel caso si rendesse necessaria un'aggiunta superiore al 10% del volume totale è bene accettare la presenza di eventuali perdite.

Ingrassaggio

I supporti in uscita prevedono la lubrificazione ad olio in comune con il riduttore oppure, per alcune specifiche versioni, la lubrificazione a grasso del cuscinetto lato uscita: in quest'ultimo caso, i supporti sono già lubrificati tramite grasso **Shell Gadus S3 T220 2** e pronti ad entrare in servizio al momento della fornitura.

Per tali versioni non è necessario prevedere l'ingrassaggio periodico, in quanto la lubrificazione a grasso è da intendersi "a vita".

L'ingrassaggio periodico è invece da effettuare per i supporti in ingresso tipo IS e ISL. Questi supporti prevedono infatti che la tenuta in ingresso sia protetta da un vano riempito di grasso che evita l'ingresso di contaminanti esterni; tale grasso deve essere periodicamente rinnovato.

Il grasso da utilizzare per l'ingrassaggio periodico è il **Polymer 400 NLGI 2** o, in alternativa, un prodotto equivalente a base di PTFE.

L'ingrassaggio deve essere eseguito utilizzando sistemi a bassa pressione per non danneggiare l'anello di tenuta.

Si consiglia di eseguire l'operazione di ingrassaggio periodico almeno ogni 6 mesi.

In case of heavy duty applications, the above values must be halved. The values given in the table refer to a work environments free from external contamination.

It is advisable to carry out the oil change with the gear unit hot, (approx. 40°C) to prevent sludge from forming and to facilitate complete draining.

For the correct procedure comply with the rules given in the installation and maintenance manual supplied with each unit.

It is advisable to periodically check the oil level.

If more than 10% the total volume has to be added, check for leaks.

Greasing

*The output supports provide for oil lubrication in common with the gearbox or, for some specific versions, grease lubrication of the output side bearing: in the latter case, the supports are already lubricated with **Shell Gadus S3 T220 2** grease and ready to enter into service at the time of delivery.*

For these versions periodic greasing is not required, as they are "lifetime" lubricated.

However, IS and ISL type input supports require periodic greasing. In fact, these supports require the input seal to be protected by a compartment filled with grease that prevents the entry of external contaminants; this grease must be periodically changed.

*The grease to be used for periodic greasing is **Polymer 400 NLGI 2** or, alternatively, an equivalent PTFE-based product.*

Greasing must be done using low pressure systems to avoid damaging the sealing ring.

It is advisable to do periodic greasing at least every 6 months.

Bei besonders erschwerten Einsatzbedingungen sind die o.a. Werte zu halbieren. Die in der Tabelle angegebenen Werte beziehen sich auf Einsatzumgebungen ohne externe Einflüsse.

Der Ölwechsel sollte bei warmem Getriebe (ca. 40 °C) vorgenommen werden, da dadurch die Ablagerung von Bodensatz vermieden und das Entleeren erleichtert wird.

Halten Sie sich dabei immer an die Installations- und Wartungsanweisungen, die jedem Getriebe beiliegen.

Kontrollieren Sie regelmäßig den Ölstand.

Sollte es notwendig sein, mehr als 10% der Gesamtmenge nachzufüllen, ist es angebracht, die Anlage auf eventuell vorhandene Lecks zu überprüfen.

Schmierung

Einige Abtriebskonfigurationen sehen die Schmierung mit Öl zusammen mit dem Getriebe vor oder bei einigen spezifischen Versionen das Schmieren der abtriebsseitigen Lager mit Fett: In diesen Fällen sind die Wellen bereits mit **Shell Gadus S3 T220 2** grease geschmiert und zum Lieferzeitpunkt einsatzbereit. In diesen Fällen ist eine periodische Schmierung nicht notwendig, da es sich um eine „Lebensdauerschmierung“ mit Fett handelt.

Die periodische Schmierung muss aber bei den Antriebskonfigurationen IS und ISL durchgeführt werden. Bei diesen Antriebskonfigurationen ist es nämlich vorgesehen, dass die antriebsseitige Dichtung durch eine mit Fett gefüllte Kammer geschützt wird, die das Eindringen von äußeren Verunreinigungen verhindert; das Fett muss periodisch erneuert werden.

Das einzusetzende Fett für die periodische Schmierung ist **Polymer 400 NLGI 2** oder alternativ ein gleichwertiges Produkt auf PTFE-Basis.

Die Schmierung ist mit Niederdrucksystemen durchzuführen, damit der Dichtring nicht beschädigt wird.

Es wird empfohlen, die periodische Schmierung mindestens alle 6 Monate durchzuführen.

QUANTITA' OLIO
OIL QUANTITY
ÖL MENGE

Le quantità d'olio riportate nelle tabelle sottostanti sono indicative: è sempre necessario controllare il livello secondo quanto riportato nei paragrafi "Controllo Olio".

The quantities of oil given in the tables below are only approximate: it is always necessary to check the level as given in the sections "Oil Check".

Die in den nachstehenden Tabellen angegebenen Ölmengen sind Richtwerte: der Füllstand ist immer entsprechend den Angaben in den Abschnitten „Ölkontrolle“ zu überprüfen.

Technologies Customized to **Every Part of the Globe**

With a global presence in 33 countries, Dana Incorporated boasts more than 100 engineering, manufacturing, and distribution facilities. Our worldwide network of local service centers provides assurance that each customer will benefit from the local proximity and responsiveness that they need.

About Dana Incorporated

Dana is an integral partner for virtually every major vehicle and engine manufacturer worldwide. We are a leading supplier of drivetrain, sealing, and thermal technologies to the global automotive, commercial-vehicle, and off-highway markets. Founded in 1904, we employ thousands of people across six continents.

About Dana Off-Highway Drive and Motion Technologies

Dana delivers fully optimized Spicer® drivetrain systems and individual product solutions to customers in construction, agriculture, material-handling, underground mining, and forestry markets, plus Brevini® motion systems for machine working functions.

Learn more about Dana's drivetrain and motion systems at
dana.com/offhighway.
